TEST DESCRIPTION	FLUSHING Flow the required rate until material is clear as indicated by no collection of foreign material in bubblers at outlets such as hydrants and blow offs. Flush at flows not less than 750 GPM for 6 inch pipe and smaller 1000 GPM for 8 inch 1500 GPM for 10 inch 2000 GPM for 12 inch. Where supply cannot produce stipulated flow rate obtain maximum available by using properly sized discharge devices. HYDROSTATIC Hydrostatic test should be made at not less than 200 PSI for two hours or 50 PSI above static pressure in excess of 150 PSI. Differential dry pipe valve clappers should be left open during test to prevent damage. All above ground piping leakage should be stopped. LEAKAGE New pipe laid with rubber gasketed joints should if the workmanship is satisfactory have no leakage at the joints. Unsatisfactory amounts of leakage usually result from twisted, pinched or cut gaskets. However, some leakage might result from small amounts of grit or small imperfections. The amount of leakage at the joints should not exceed 2 quarts per hour per 100 joints respectively of pipe diameter. The leakage should be distributed over all joints. If such leakage occurs at a few joints the installation should be considered unsatisfactory and necessary repairs made. New pipe laid with caulked lead or lead substitute joints should if the workmanship is satisfactory have little or no leakage at the joints. Any joint having leakage or more than a slight drip or weeping should be repaired. Leakage should not exceed 1 oz (liquid measure) per hour per inch of pipe diameter per joint. The leakage should be distributed over all joints. If such leakage occurs almost entirely at a few joints the installation should be considered unsatisfactory and necessary repairs made. PNEUMATIC Establish 40 PSI air pressure and measure pressure drop which should not exceed 1/2 PSI in 24 hours. Test pressure tanks at normal water level and air pressure and measure air pressure drop which should not exceed 1/2 PSI in 24 hours.
