

HYDRO-SEEDING

- A. Before lawn planting all finish grading shall be complete. Lawn planting shall be accomplished by Hydraulic Seeding. Seeding shall **not** be performed when the wind velocity is detrimental to the uniform distribution of the seed.
- B. Hydro-seed with 100 percent Rebel 2, 94 percent purity and germination, at the rate of not less than twelve (12) pounds per 1,000 square feet for Rebel 2. The seed bed shall be in a moist, friable condition when seeding is begun. Seeding shall be done as soon as soil conditions allow after the initial watering of the amended soil. Seeding done in soil that is too wet or too dry, or in a condition not generally accepted as satisfactory for lawn seeding, will not be accepted.
- C. The seed, fertilizer, fiber and other materials in the slurry mixture shall be as specified below. All materials shall be of such character that they will disperse into a uniform slurry when mixed with water. The mixture shall be such that an absorbent porous mat will be formed.
- D. All materials must be available for inspection prior to application. Weights and contents of containers shall be clearly identified. A green coloring additive shall be used in the slurry for visual inspection purposes during application.
- E. The slurry shall be applied under pressure. Fiber mulch at fifty (50) pounds per 1,000 square feet. Areas to be planted by this method shall be moistened to a depth of six (6) inches but shall not surface wet at the time of application. The hydraulically seeded areas shall be kept moist during the germination period, but puddling shall be avoided.
- F. Wet seeded areas thoroughly. Keep lawn moist throughout germination period.
- G. When hydro-seeding operations are complete, stake off area with 48" surveyors lath at 10' o.c. Apply two (2) rows of fluorescent pink surveyors ribbon between the lath, one at the top and one half way up. Twist the ribbon twice around each lath to secure it.
