REMARKS: Master Plan Amendment

5th Submittal: Update to the Amendment to the 2013 Las Vegas Valley Flood Control Master Plan Update

4th Submittal: Amendment to the 2013 Las Vegas Valley Flood Control Master Plan Update

3rd Submittal: Update #2 to revise a regional facility in *Horse Drive* to turn south at *Aviary Way*

2nd Submittal: Update #1 & Supplement #1 to propose a regional facility in *Horse Dr.* east of *Decatur Bl.*

1st Submittal: Development split into two projects.

The Drainage Study for the subject project has been reviewed and:

	is approved subject to conformance to all City standards and the following conditions:
	must be resubmitted or supplemented including the following:
	is conditionally approved subject to Clark County Regional Flood Control District concurrence.
X	is conditionally approved subject to Clark County Regional Flood Control District **Master Plan Amendment Approval**.

***City of Las Vegas Flood Control* staff has reviewed the Update to the Amendment to the 2013 Las Vegas Valley Flood Control Master Plan Update, Technical Drainage Study, Addendum #1 and Addendum #2; Update #1, Supplement #1 and Update #2 of the subject development in the *City of North Las Vegas*. *City of Las Vegas* concurs with the acceptance of the drainage study by the**

City of North Las Vegas Department of Public Works.* The review of this project was limited to issues of flood control significance to the *City of Las Vegas.

1. It is conceptually acceptable to re-route the regional facility at *Horse Drive* from going south in *Decatur Boulevard* (GTEA 0360 to be eliminated) to continuing east in *Horse Drive* (AVHR 0094). However, the study did not provide a collection system at the intersection of *Horse* and *Decatur* which must be a part of the regional facility system. Drop inlets and or other collection system in *Horse Drive* on the west side of *Decatur Boulevard* (within *City of Las Vegas* jurisdiction) will be required in a technical drainage study and improvement plans for the construction of *Horse Drive* regional storm drain system.

2. Study flow rates at the Grand Teton facility are based upon a *Clark County Regional Flood Control District Master Plan Amendment (MPA)* being adopted. Future MPU facilities will significantly impact these proposed facility improvements without the approval of the MPA. **If the MPA is not approved, the drainage studies and improvement plans must be updated to accommodate the flow impacts from the adopted Master Planned Facilities.**

3. Approval is predicated upon the construction of the *Grand Teton Regional Flood Control Facility* improvements at the west side of the intersection of *Decatur Boulevard* and as shown on the improvement plans prepared by SHG dated 11-12-2013.

NOTE: Any future changes to the proposed design (or design assumptions) as outlined in the approved drainage study and attached preliminary grading plan which affect drainage must be addressed in a Drainage Study Amendment and accepted by the *City of Las Vegas Flood Control Section.* Additionally, conditional acceptance of a drainage study is valid for a period of one (1) year. If the proposed construction has not been completed in that time period, the *City of Las Vegas* reserves the right to require additional conditions and/or submission and acceptance of a complete drainage study update prior to further construction of a project.

NOTE: Please be advised that all land surface area disturbances over 1 acre or any area adjacent to a water way must submit to the *Nevada Division of Environmental Protection* a "Notice of Intent" to discharge that certifies a stormwater pollution prevention plan has been developed and is maintained on site; for inclusion in the Stormwater General Permit No. NVR100000. A phased construction unit in a contiguous subdivision is considered under construction until all stripped or disturbed surface areas have been covered by paving, building construction or planting. For more information, including forms and applications see http://ndep.nv.gov/bwpc/storm01.htm or call (775) 687-9429.

- Cost Estimating Tool
- GIS files
- Horse Alignment Alternative Assessment
- PDF of Report

1 INTRODUCTION

1.1 Overview & Study Purpose

This Amendment to the Clark County Regional Flood Control District (CCRFCD) 2013 Las Vegas Valley Flood Control Master Plan Update (2013 MPU) has been prepared to incorporate the addition, removal and re-alignment of regional facilities associated with the Park Highlands West master planned development. This Amendment has been prepared on behalf of Argent Management, LLC in coordination with the City of North Las Vegas Department of Public Works (CNLV) in compliance with NRS 543.597. CNLV is functioning as the applicant for formal adoption of this Amendment.

The approximate 600 acre property identified as Park Highlands West is located within the city limits of North Las Vegas, Nevada and borders the city limits of Las Vegas, Nevada. The Park Highlands West (PHW) site is generally bound by Grand Teton Drive to the north, Aliante Parkway to the east, Dorrell Lane to the south and Decatur Boulevard to the west. A location map, Exhibit A included in the Appendix A, has been provided for spatial reference.

Currently, several existing and future regional facilities are located within the vicinity of the PHW property. Due to a value engineered flood control alternative associated with the PHW project, some of the current existing and future regional facilities are revised as part of this Amendment. This Amendment addresses the changes to affected facilities proposed by the PHW project. This Amendment was prepared in accordance with analyses consistent with that of the 2013 MPU planning document. Once complete, the regional facilities will function to provide flood protection for residential lots, public schools, parks, commercial development and other community amenities.

1.2 Agency Coordination

Agency coordination was conducted with CNLV and CCRFCD as well as the City of Las Vegas (CLV) and Clark County Public Works (CCPW) in preparation of this Amendment. A technical workshop was conducted on April 24, 2014 with multiple agencies and Park Highland West representatives. Two follow-up coordination meetings were held on April 24, 2014 and April 29, 2014 with CCPW and CNLV, respectively. After several correspondences with CNLV and CCRFCD during the month of November in 2014 to discuss the acceptability of the original Horse Alignment (from the Horse Drive/Decatur Boulevard intersection and extending entirely along Horse Drive with discharge at the Horse Drive/Aliante Parkway intersection onto BLM land), an alternative assessment meeting was held on December 3, 2014 with CNLV and CCRFCD. The result of that meeting was to proceed with the Aviary Alternative to the Horse Alignment (from the Horse Drive/Decatur Boulevard extending east along Horse Drive, south along Aviary Way and terminating with connection into the reinforced concrete arch within Grand Teton Drive). The meeting minutes are provided in Appendix I for reference. Outside of formal meetings, coordination with various agencies was conducted via phone calls and e-mails.

The Amendment (dated December 2014) was conditionally approved by CNLV and CLV on May 6, 2015 and May 14, 2015, respectively. Subsequently, the Amendment (dated December 2014) was submitted to CCRFCD on May 18, 2015 and CCRFCD comments were issued on June 8, 2015. A coordination meeting with CCRFCD and CNLV was held on June 29, 2015 to discuss the CCRFCD comments. The Amendment (dated July 2015) had been revised based on the CCRFCD comments issued on June 8, 2015 and the outcome of the coordination meeting on June 29, 2015. Subsequently, on November 12, 2015, CNLV issued two verbal comments on the Amendment (dated July 2015). A coordination meeting with CNLV and CCRFD was held on February 2, 2016 with subsequent e-mail correspondence for direction. This Amendment (dated February 2016) has been revised based on the CNLV comments issued on November 12, 2015 and subsequent agency coordination.

For the record of this Amendment, a copy of the agency coordination is provided in Appendix I. The comment letters and the response to the individual comments are provided in Appendix J.

1.3 Reference Studies

The *Master Drainage Study for Park Highlands West (*hereafter referred to as the Master Study*, Reference 4)* prepared by Slater Hanifan Group provided the land plan for the property and a detailed hydrologic analysis of the offsite and onsite watershed. The offsite watershed established new planned regional facility in Horse Drive, hereafter called the Horse Alignment. The Master Study was approved by CNLV on April 23, 2014 and concurred by CLV and CCRFCD on June 3, 2014 and May 19, 2014, respectively. As a condition on the Master Study approval, CNLV required the processing of an Amendment to the 2013 MPU. Note that the facilities considered regionally significant to be incorporated in this Amendment had been identified in the approved Master Study. Relevant reference material from the Master Study is provided in Appendix F.

The *Update No. 1 to the Master Drainage Study for Park Highlands West (*hereafter referred to as the Update Master Study*, Reference 5)* prepared by Slater Hanifan Group addressed the increase in storage capacity of the Park Highlands West Detention Basin. The purpose of the Update Master Study was to remove the multi-use bench within the detention basin intended for a future dog park which resulted in the increased storage capacity. Note that the Update Master Study did not alter the land plan for the property nor the detailed hydrologic analysis of the offsite and onsite watershed that was approved with the Master Study. The Update Master Study was approved by CNLV on September 25, 2014 and concurred by CLV and CCRFCD on November 5, 2014 and October 15, 2014, respectively. Note that Update Master Study is not referenced by this Amendment but is discussed for informational purposes.

After coordination with the governing agencies on the acceptability of the Horse Alignment and alternatives for the Horse Alignment, per e-mail corresponds with CNLV on December 4, 2015, the Park Highlands West Amendment will proceed with the Horse Alignment utilizing the Aviary Alternative towards the Park Highlands West development and detention basin. This revision to the Horse alignment alters the offsite drainage pattern presented in

the Master Study and Update Master Study. Please see Section 1.4 of this Amendment for detailed discussion about the initial Horse Alignment and subsequent alternative assessments. The resulting revisions to the Horse Alignment turning south along Aviary Way prompted another update to the Master Drainage Study for Park Highlands West. The *Update No. 2 to the Master Drainage Study for Park Highlands West* (hereafter referred to as Master Update 2) prepared by Slater Hanifan Group addressed the necessary changes to drainage infrastructure to accommodate the additional flow into the regional mainline drainage system in Grand Teton Drive and the Park Highlands West detention basin. The Master Update 2 provides the most current ultimate condition watershed analysis, Park Highlands West detention basin stage-storage-discharge, and drainage infrastructure inventory. The Master Update 2 was approved by CNLV on April 6, 2015 and concurred by CLV and CCRFCD on April 27, 2015 and April 30, 2015, respectively. Relevant reference material from the Master Update 2 is provided in Appendix G.

Unlike a typical master planned community in which technical drainage studies are prepared following the approval of the Master Study; a technical drainage study has been prepared prior to and concurrently with the Master Study to support the proposed regional alignment along Grand Teton Drive discharging to the proposed Park Highlands West detention basin and the outlet system. The *Technical Drainage Study to the Grand Teton Regional Flood Control Facility* (hereafter referred to as the Technical Study) prepared by Slater Hanifan Group has also undergone two updates just like the Master Study. The reasons for updates outlined for the Master Study are the same for the Technical Study. The subsequent updates to the Technical Study are hereafter referred to as Technical Update 1 and Technical Update 2. The Technical Study was approved by CNLV on May 6, 2014 and concurred by CNLV and CCRFCD on March 4, 2014 and April 15, 2014, respectively. The Technical Update 1 was approved by CNLV on September 25, 2014 and concurred by CNLV and CCRFCD on August 28, 2014 and October 1, 2014, respectively. The Technical Update 2 was approved by CNLV on June 4, 2015 and concurred by CNLV and CCRFCD on May 7, 2015 and April 30, 2015, respectively.

1.4 Horse Alignment Alternative Assessment

The original Horse Alignment was planned by the Master Study and the Update Master Study to extend east in Horse Drive from Decatur Boulevard, past Aliante Parkway thru BLM land to the North Las Vegas Detention Basin. Due to constraints associated with extending a regional alignment thru the Conservation Transfer Area (CTA) that overlaps with BLM land, two alternatives were considered to address regional connectivity. The two alternatives considered are as follows:

- **Decatur Alternative:** Default to the 2013 MPU and maintain the regional facility GTEA 0360 which would require an upsizing to the regional facility in Grand Teton Drive between Decatur Blvd and the proposed Park Highlands West Detention Basin.
- **Aviary Alternative:** Extend a regional facility along Horse Drive between Decatur Blvd and Aviary Way which then extends south in Aviary Way towards the proposed Park Highlands West Detention Basin. This would require an upsize in the regional

facility in Grand Teton Drive between Aviary Way and the proposed Park Highlands West Detention Basin.

It should be mentioned that in both alternatives, the proposed Park Highlands West Detention Basin does not require any upsizing. There is adequate storage volume for the additional flow while meeting all CCRFCD Manual criteria. The resulting peak elevation is a minimum of 1-ft below the spillway and detention basin storage still has enough capacity to accommodate the computed sediment and water quality storage volumes. Additionally, it should be highlighted that with the more detailed examination of the Decatur Alternative, the facilities proposed with the Decatur Alternative is larger than what the 2013 MPU identifies for GTEA 0360.

For each alternative, the conceptual facility design was based on normal depth computations for facility sizes and overlaid onto the plan and profile of as-built plans to establish utility conflicts and constructability issues. Note that the flow rates used in the conceptual design were obtained by modifying the drainage pattern of the drainage basins from the Master Study as that provided a more detailed assessment of the watershed as well as a greater flow rate than what has been generated from the hydrologic assessment provided in this Amendment. The probable construction costs were based on current available unit pricing for the mainline facilities and potential utility conflicts.

The conceptually designed facilities associated with each alternative were used to select the preferred alternative; they were assessed with the following conditions:

- Utility Conflicts/Constructability
- Construction Cost to CNLV/CCRFCD

After reviewing the alternatives on December 3, 2014 during an assessment meeting, CNLV and CCRFCD are in support of the Aviary Alternative for the Horse Alignment. The preliminary supporting hydraulic computations, plan and profiles, and probable construction costs for each alternative have been provided electronically on a CD in Appendix K for reference.

1.5 Regional Facility Overview

As outlined in the 2013 MPU, proposed regional facilities are generally described as those with a minimum storm flow rate of 500 cfs during the 100-year storm event, or have a minimum contributing drainage area of 1 square mile. The regional facilities presented in this Amendment meet either one or both of these criteria.

This Amendment has incorporated facilities that have been identified as either existing or Category A.

- Existing facilities are existing drainage infrastructure that is being incorporated as a regional alignment.
- Category A facilities are identified essential for the protection of existing development, and often times receives public funding for construction.

Note that the regional facilities proposed onsite to the Park Highlands West community are identified in this Amendment as Category A facilities as requested by CCRFCD. The Park Highlands West onsite facilities are necessary to protect its future onsite development and existing development downstream of the Park Highlands West community. This Amendment has also incorporated the existing drainage infrastructures through the Aliante residential development and Aliante Casino to the I-215 beltway for connectivity of regional facilities. The existing facilities proposed as a regional alignment in this Amendment have been designed by several technical drainage studies that have been approved by CNLV. The flow rate reported by this Amendment does not represent the design flow rate of the individual facilities. Provided in Appendix A is an exhibit (Exhibit D) that takes inventory of the design flow rate of the individual facilities and in Appendix H is a copy of the hydraulic assessment from the referenced technical drainage studies approved by CNLV. Variations between final design and the MPU are considered common and acceptable.

The proposed offsite regional facilities to the Park Highlands West community are also identified as Category A facilities in this Amendment as requested by CCRFCD. The offsite facilities are necessary to provide a preferred flow path to protect developments and serve as connectivity of regional facilities.

Conceptual sizing and cost estimating criteria outlined in the 2013 MPU have been utilized for determination of all facilities affected by this Amendment. This Amendment has been prepared for the purpose of future planning. Future technical hydraulic analyses will be required to support final designs and potentially minimize planned project costs. Variations between final design and the MPU are considered common and acceptable.

2 HYDROLOGIC ANALYSES

2.1 Conformance to 2013 MPU

This Amendment has been prepared in a manner consistent with the hydrologic analyses included in the 2013 MPU (Reference 1).

2.1.1 Computer Modeling

The SCS Unit Hydrograph Method (SCS Method) was utilized to determine peak flow rates. The SCS Method utilizes precipitation, drainage area, curve number and lag time parameters to determine peak flow rates. The SCS Method routine within the U.S. Army Corp of Engineer's HEC-1 Flood Hydrograph Package program (version 4.1, June 1998) was utilized to model the drainage subbasins analyzed by this Amendment.

2.1.2 Design Storm, Distributions & Depth-Area Reduction Factors

A 6-hour, 100-year storm event has been utilized to determine peak flow rates for use in this Amendment. A 100-year storm event is defined as having a 1.0 percent chance of being equaled or exceeded in any given year.

This Amendment affects facilities with contributing drainage areas of all sizes up to the maximum 200 square miles outlined in the 2013 MPU. Therefore, Storm Distribution Number (SDN) 3, 4 and 5, defined in the Table 503 of the CCRFCD Design Manual have all been utilized in this Amendment.

- SDN3 has been utilized to determine peak flow rates in facilities that have contributing drainage areas less than 8 square miles in size.
- SDN4 has been utilized to determine peak flow rates in facilities that have contributing drainage areas between 8 and 12 square miles in size.
- SDN5 has been utilized to determine peak flow rates in facilities that have contributing drainage areas greater than 12 square miles in size.

Depth-Area Reduction Factors (DARF) are utilized to account for rainfall variation over larger watershed areas, and truncate the precipitation depths to better represent average depth of rainfall as storm area increases. DARFs have been utilized in this Amendment at each concentration point based on upstream tributary area. The DARF values have been directly referenced from the Table 4-1 in the 2013 MPU.

2.1.3 Storm Centering

The hydrologic modeling presented in the 2013 MPU had been broken into three (3) categories: Series A, B and C. These individual series have been utilized for planning purposes to determine peak flow rates in specific areas of the watershed. Per the 2013 MPU, the areas and facilities affected by this Amendment are all Series C centering. Further discussion regarding the storm centering hydrologic models prepared in this Amendment has been included in Section 2.2.

2.1.4 Precipitation

NOAA Atlas rainfall depths determined by methodology presented in the CCRFCD Design Manual have been converted into GIS format. This Amendment has utilized GIS spatial analysis of the rainfall grid to compute weighted average rainfall depths for each subbasin. A summary of the Amendment 100-year storm rainfall depths have been included on the Standard Form 4 calculations included in Appendix B.

2.1.5 Land Use, Soils & Curve Numbers

Utilizing the current land plan approved in the Master Study, included in Appendix G, the onsite land uses have been correlated to the appropriate Land Use Index Number presented in the 2013 MPU Table 4-2. Note that the Park Highlands West property is inside the drought ordinance boundary presented in the 2013 MPU; therefore, the onsite Land Use Index Numbers have been selected accordingly. The offsite areas within this Amendment's subbasins have assumed the same land use as previously presented in the 2013 MPU, where deemed appropriate.

The 2013 MPU soils data GIS layer has been utilized to determine the soils within each subbasin affected by this Amendment. Utilizing the soils data and the appropriate land uses, curve numbers have been selected from the 2013 MPU Table 4-3 Curve Number

Matrix included in Appendix E. The associated weighted curve number calculations prepared for this Amendment has also been included in Appendix B.

2.1.6 Lag Time & Routing

All subbasins modified by this Amendment are less than 1 square mile; therefore the lag times were calculated by the Time of Concentration Method outlined in the 2013 MPU, which is in conformance with methodology in the CCRFCD Design Manual Standard Form 4 computation.

As included in the 2013 MPU, routing has also been utilized in this Amendment's hydrologic modeling. The MPU functions as an ultimate condition hydrologic model; therefore, it is assumed that all routing included in this Amendment is thru improved facilities with the exception where regional flood control alignments are classified as a natural wash. As a result, Muskingum-Cunge routing has been utilized for improved facilities and Muskingum routing has been utilized for natural washes in this Amendment.

2.2 Amended Lower Northern Las Vegas Wash Watershed Description

The revisions proposed in this Amendment are within the Lower Northern Las Vegas Wash watershed which is located in the northern portion of the Las Vegas valley. The 2013 MPU Hydrologic Summary Exhibits 14 and 15 have been revised accordingly to illustrate the proposed subbasins and routing. The drainage patterns presented in this Amendment are consistent with those established in the approved Master Update 2 which reflects the Aviary Alternative to the Horse Alignment.

As a result of the regional alignments proposed with this Amendment and the detailed assessment of the watershed (conducted by the Master Update 2) there are significant differences in hydrologic patterns between the 2013 MPU and this Amendment. See Exhibit B, in Appendix A, for an annotated exhibit highlighting all the hydrologic changes and the changes are as follows:

- The addition of three new flow splits at the following locations:
  - Horse Drive and Jones Boulevard intersection
  - Horse Drive and Bradley Road intersection
  - Brent Lane and Decatur Boulevard intersection
- The relocation of an existing flow split from the Iron Mountain Road and Bradley Road intersection to the Iron Mountain Road and Jones Boulevard intersection. The relocation was due to where the split actually will occur.
- The following subbasins were modified as follows:
  - The southern limits of 2013 MPU Subbasin GT03A were extended south to Horse Drive and then it was divided into four subbasins: GT03AW, GT03AE, GT03CW and GT03CE.
  - The northern limits of 2013 MPU Subbasin GT03B were reduced to Horse Drive and then it was divided into two subbasins: GT03BW and GT03BE.
  - 2013 MPU Subbasin GT03E was divided into two subbasins: GT03EN and GT03ES.

  - 2013 MPU Subbasin NN032-C limits to the south were reduced to Virage Park Drive.
  - 2013 MPU Subbasin NN048-C was divided into Subbasins NN048-CW and NN048-CE.
  - 2013 MPU Subbasin NN033-C limits to the north were extended to Virage Park Drive.
  - 2013 MPU Subbasin GT03E was divided into two subbasins: GT03EN and GT03ES.
- The drainage patterns associated with the new subbasins as follows:
  - Subbasin GT03AW drains to the Brent Lane and Decatur Boulevard intersection where a flow split occurs.
  - Subbasin GT03AE and the easterly flow split from Subbasin GT03AW drains east into the Las Vegas Wash.
  - Subbasin GT03CW and the southerly flow split from Subbasin GT03AW drains to the Aviary Way and Horse Drive intersection to be routed south along Aviary Way.
  - Subbasin GT03CE drains east to Subbasin GT03EN
  - Subbasin GT03BW drains to the Aviary Way and Grand Teton Drive intersection to be routed into the Park Highlands West detention basin.
  - Subbasin GT03BE drains to the Aliante Parkway and Grand Teton Drive intersection to be routed east along Grand Teton Drive.
  - The new limits of Subbasin NN032-C drain into the Park Highlands West detention basin.
  - The new limits of Subbasin NN033-C drain southeasterly onto Subbasin NN048-C.
  - Subbasin NN048-CW defines the area contributing flows to the existing culverts crossing Lintwhite Street which still drains to the Beltway system.
  - Subbasin NN048-CE defined the area contributing to the Beltway system downstream of the existing culverts crossing Lintwhite Street.
- The curve number (CN) values for subbasins NN032-C, NN033-C and NN020-C were adjusted to reflect the current approved land plan with the Master Study. Note that subbasin NN034-C did not require any CN value adjustment. The following land use was changed:
  - Subbasin NN032-C, where the Park Highlands West detention basin is proposed was previously classified as land use '16' (high density residential). With this Amendment, it was re-classifies as land use '7' to represent public facility.
  - Subbasin NN033-C, previously identified a parcel for a park with a land use of '2' (park, golf course). With this Amendment, it is re-classified as land use '16' for high density residential.
  - Subbasin NN020-C , previously identified a parcel for a park with a land use of '2' (park, golf course)and an adjacent parcel with high density residential (land use '16'). With this Amendment, the limits of the park increased which decreased the limits of the adjacent high density residential.
- The watershed from the west draining to the North Las Vegas Detention Basin has reduced. The reduction is due the re-routing of subbasins associated with the proposed regional alignments.

- The watershed from the northwest draining to the I-215 Beltway between Aliante Pkwy and North 5th has increased. The increase is due the re-routing of subbasins associated with the proposed regional alignments.
- The Park Highlands West Detention Basin is proposed to offset the increase in the contributing drainage area and flow rate to the I-215 Beltway system.

With the modified regional alignments and drainage patterns presented in this Amendment, there are the following impacts to the Villages at Tule Springs (previously known as Park Highlands East):

- Without a regional alignment along Grand Teton Drive between Aviary Way and the Las Vegas Wash, offsite flows from the north of the Villages at Tule Springs will enter along the Grand Teton Drive alignment. Villages at Tule Springs will need to identify the need for local storm drain facilities based upon their proposed onsite drainage pattern to intercept the approaching offsite flows.
- Villages at Tule Springs will need to identify the discharge location of the intercepted/routed the offsite flows and demonstrate no adverse impacts to existing drainage infrastructure and adjacent properties.
- As a result of this Amendment, the planned regional facility FMEA 0006 within the Villages at Tule Springs limit will need to be increased from a 7'x5' RCB to a 10'x5' RCB.

Villages of Tule Springs are aware of this Amendments' impact to their property. Additionally, it is anticipated that the Villages at Tule Springs will prepare their own Amendment to address their planned land use, delineation/routing of subbasins and drainage facility configurations/ alignments that are of regional significant.

The following hydrologic models have been updated by this Amendment. Relevant excerpts of the HEC-1 hydrologic models and their SDNs utilized to determine peak flow rates for estimating regional facility sizing have been included in Appendix B. All updated HEC-1 models and their SDNs associated with this Amendment have been included on CD included in Appendix K.

- Model **CWEST** has been utilized for the portion of the watershed routed to the LVUP and EKEA alignments which is inclusive of the drainage area revised with this Amendment. This is a Series B model which removes all detention basin discharges out of the model. The CWEST model controlled some of the segments along LVUP and EKEA.
- Model **WEST** has been utilized for the portion of the watershed routed to the LVUP alignment downstream of the North Las Vegas Detention Basin and EKEA alignment between Aliante Pkwy and North 5th. This is a Series C model that represents a storm centering over areas downstream of the existing Upper Las Vegas Wash Detention Basin which is inclusive of the area contributing to and downstream of the North Las Vegas Detention Basin.
- Model **LOWER** has been utilized for the portion of the watershed routed to the LVUP alignment upstream of the North Las Vegas Detention Basin. This is a Series C model that has been utilized to size the Upper Las Vegas Wash Detention Basin and

presents the controlling flow rate in the Las Vegas Wash just downstream of the Upper Las Vegas Wash Detention Basin.

- Note that models **UPLVW, CLVMD** and **CCWEST** have not been utilized for the portion of the watershed routed to the LVUP and EKEA alignments but are inclusive of the drainage area revised with this Amendment. These are Series C models. Since all facilities addressed by this Amendment utilize the CWEST, WEST and LOWER models for sizing, the UPLVW, CLVMD and CCWEST models have not been updated.

3 AMENDED MPU FACILITIES

3.1 Conformance to 2013 MPU

This Amendment has been prepared in a manner consistent with the hydraulic facility sizing analyses included in the 2013 MPU. The CCRFCD issued Facility Sizing Tool – Version 9a has been utilized in this Amendment.

3.1.1 Channels, Storm Drains, Culverts and Bridges

The flow rates obtained from this Amendment's hydrologic models have been applied to the Sizing Tool, which utilizes Manning's equation and normal depth computations to determine flow depths. Upon computing flow depths, freeboard and upsizing factors have been applied to the conveyance facilities in the Sizing Tool as outlined in the 2013 MPU.

3.1.2 Detention Basins

The PHW detention basin parameters utilized in this Amendment are referenced from the Master Update 2. The Modified Puls routing method within the HEC-1 computer program has been utilized to determine the peak flow attenuation after the flow is routed thru a detention basin. Included in the referenced detention basin parameters found in the Master Update 2 are the following:

- The stage-discharge curve has been developed utilizing the orifice equation.
- The storage volume accounts for debris to deposit and the Water Quality Capture Volume (WQCV) at the bottom of the basin.
    - Sediment transport volumes have been determined by use of the Modified Universal Soil Loss Equation (MUSLE) outlined in the CCRFCD Design Manual Section 1301.7.4, Equation 1307.
    - The WQCV has been determined by the methodology and requirements presented in the Technical Memorandum IV.11 from the Las Vegas Valley Municipal Separate Storm Sewer System Permit.
- Per coordination with CNLV and CCRFCD, a PMF spillway was not necessary for the proposed Park Highlands West Detention Basin. It is proposed that providing a spillway capable of discharging the entire PMF storm event peak flow was unnecessary since a storm of that magnitude is incapable of discharging into the detention basin. The spillway has been designed with a discharge conveyance based on the capacity of the inflow pipe at surcharge. Therefore, the spillway is

capable of discharging maximum inflow to the basin regardless of storm event, including during a PMF event, back-to-back 100-year event, etc.

The design of the Park Highlands West detention basin yields both a peak and water quality drain time of approximately 15 hours. The drain time does not exceed the maximum drainage time of 7 days and a preferred drain time of less than 24 hours as outlined in the CCRFCD. Note that the drain time through the existing Aliante Golf Course was outlined in detail with the Technical Update 2 which was approved by CNLV and concurred by CLV and CCRFCD.

3.2 Summary of Amended MPU Facilities

The 2013 MPU Flood Control Facilities Exhibits 14 and 15 have been revised accordingly to illustrate the modified regional flood control facilities proposed by this Amendment. See Exhibit C, in Appendix A, for an annotated exhibit highlighting all the facility changes. The following are the revised flood control facilities presented in this Amendment:

- Local existing and proposed facilities, as shown in the Master Update 2, have been identified on the revised MPU Flood Control Facilities Exhibits.
- The regional facilities and alignments addressed in this Amendment are consistent with the plan presented in the Master Update 2.
- All proposed regional facilities within the Park Highlands West property boundary have been provided as Category A facilities as requested by CCRFCD.
- Changes to future offsite facilities by this Amendment, have been proposed as Category A facilities as requested by CCRFCD.
- Associated with this Amendment is the re-routing of a regional alignment and the addition of alignments. Note that due to the methodology of providing river mile IDs for each segment of regional facility, the 2013 MPU river mile IDs for GTEA could not be reused. Table 1 summarizes the specific 2013 MPU facilities that are being replaced/realigned and added by this Amendment.

Table 1: Summary of Facilities Removed and Added

2013 CCRFCD MPU (Removed)				Park Highlands West Amendment (Added)			
ID / River Mile	Status	Facility Description	Flow (cfs)	ID / River Mile	Status	Facility Description	Flow (cfs)

				0102	E	10' X 5' RCA	344
				0139	E	14' X 5' RCB	344
				0141	P1	53" Orifice, 72" RCP	226
				0168	P1	1,697 cfs Spillway	1,697
				0169	P1	170 ac-ft Park Highlands West Detention Basin	1,230
				0192	P1	14' X 7' RCA	1,172
				0198	P1	12' X 7' RCA	1,020
				0236	P1	12' X 5' RCB	936

It should be noted that all of the proposed facilities along the AVHR and GTEA regional alignments have been identified based on a more technical or detailed assessment found in the Master Update 2 and Horse Alignment Alternative Assessment. Variation in the flow rate between a technical design and the MPU are considered common and acceptable.

- Several regional alignments not being altered by this Amendment will have a revised flow rate. The revised flow rate is due to the change in drainage pattern and the Park Highlands West detention basin. The change in flow rate has been tracked to a point where the change in flow rate is considered negligible and shows no adverse impacts to downstream drainage infrastructure. The Sizing Tool provided in Appendix C supports that with the change in flow rate, facilities are still sufficiently sized. The facilities that are impacted as described by this Amendment have been included on the MPU Facility Inventory exhibits and summarized in Table 2.

Table 2: Summary of Flow Changes for Unrevised Facilities

0404	E	3: 84" RCP Outlet	3,150	3,120
0405	E	1,435 ac-ft North Las Vegas Detention Basin	13,137	12,887
0406	P1	Upgrade to 2,215 ac-ft North Las Vegas Detention Basin	13,137	12,887
0422	P0	4: 10' X 8' RCB	4,393	4,237
0446	E	Floodway	4,393	4,237

In review Table 2, the flow rates to some facilities have decreased while for others it has increased. For the facilities where the flow rate has decreased, it was deemed unnecessary to downsize the facility. For the facilities were the flow rate has increased, the facilities still meet the 2013 MPU sizing criteria and do not require an upsize. Please refer to the Facility Sizing Tool results in Appendix C.

It should be noted that the facilities along the LVUP system downstream of LVUP 0268 show a decrease in flow rate, so the flow rate associated with the hydrologic analyses in this Amendment was not revised in the MPU Facility Inventory exhibits.

3.2.1 Grand Teton Drive System East (GTEA)

As part of this Amendment the GTEA alignment has been renamed as "Grand Teton Drive System East" to better reflect the drainage infrastructure along the alignment instead of "Grand Teton Drive Channel East".

The current 2013 GTEA alignment begins at the intersection of Decatur Blvd and Horse Drive. The alignment is located along Decatur Blvd and extends south to Grand Teton Drive. At the Decatur Blvd and Grand Teton Drive intersection, the alignment extends east in Grand Teton Drive to the Las Vegas Wash to connect to the LVUP alignment. This Amendment proposes the following revision to the GTEA alignment:

- Remove the GTEA 0360 facility; located in Decatur Blvd between Horse Drive and Grand Teton Dr.
- The GTEA alignment is proposed to begin at the Grand Teton Drive and Decatur Blvd intersection and extend east to Aviary Way, GTEA 0236 and 0198.
- At the Grand Teton Drive and Aviary Way intersection the alignment continues southeast into a detention basin and then through the Park Highlands West site, GTEA 0192, 0168, 0169, 0141, 0139, and 0102.
- At the eastern limit of the Park Highlands West site north of Elkhorn Rd the alignment extends east through the existing Aliante property/golf course and Aliante Casino, GTEA 0096, 0095, 0078, 0075, 0073, 0072, 0058, 0057, 0042, 0038, and 0000.
- The proposed GTEA alignment connects to the EKEA alignment along the I-215 Beltway, EKEA 0234.

3.2.2 Aviary – Horse (AVHR)

Additionally, this Amendment added the AVHR alignment for "Aviary – Horse" to replace the 2013 MPU regional facility GTEA 0360.

- The proposed AVHR alignment begins at the Decatur Blvd and Horse Drive intersection and extends east along Horse Drive. At Horse Drive, the alignment turns south along Aviary Way to connect into the proposed GTEA facility at the Grand Teton Drive and Aviary Way intersection. This Amendment proposes the following AVHR facilities: The proposed infrastructure along Horse Drive east of Decatur Blvd is AVHR 0094 and 0075 which connects to the existing infrastructure in Horse Drive AVHR 0050.
- The proposed infrastructure along Aviary Way between Horse Drive and Grand Teton Drive is AVHR 0020 and 0000.

Per coordination with CNLV and CCRFCD, the addition of the AVHR regional facilities is an acceptable alternative to 2013 MPU regional facility GTEA 0360.

4 COST ESTIMATION

4.1 Conformance to 2013 MPU

This Amendment has been prepared in a manner consistent with the cost estimating included in the 2013 MPU. The CCRFCD issued Cost Estimating Tool has been utilized in this Amendment to prepare the facility costs required for regional planning. The Cost Tool is a Microsoft Access database that incorporates all cost estimating equations and factors identified in the 2013 MPU. Note that the cost estimates produced by the Cost Tool are valued in 2006/2007 dollars.

The total cost of each facility has been determined by the following equation:

$$Total\ Cost = CC^{1} + D\&A^{2} + R/W^{3}$$

1. *CC (Construction Cost) = (Basic/Major Component Cost + Sum Minor Component Costs) x 10%(Contingency)*
2. *D&A (Design & Administration) = 20%(CC) = 10% for Design + 10% for Administration*
3. *R/W (Right-of-Way) = 16%(TC)*

In addition, operation and maintenance (O&M) costs are also calculated by the Cost Tool, but individualized as a separate annual expense for the facilities on the regional plan and not included in this Amendment.

With the 2013 MPU, a 0.773 factor is applied to the resulting costs reported with the Cost Estimating Tool. Therefore, the same 0.773 factor is applied to the values reported in this Amendment.

4.1.1 Construction Cost - Major Component

The Major Component Cost is generally associated with the unit cost (UC) per bid measurement. For example, the cost for reinforced concrete pipe (RCP) is computed as the UC multiplied by linear feet (LF) of facility. The UC is computed by statistical regression equation for different types of facilities originating from several bid tabulations, as outlined in the 2013 MPU.

4.1.2 Construction Cost - Minor Component Cost

For each type of facility, different minor component costs have been tabulated to determine total cost. For example, channel excavation has not been included as a cost for an underground storm drain. The list of minor components and associated cost equations utilized for each type of facility has been identified in the 2013 MPU.

5 SUMMARY TABLES

5.1 Existing Facilities

As part of this Amendment, existing drainage infrastructures are utilized to route flows and provide regional connectivity. Table 3 summarizes the existing drainage infrastructures that are being incorporated as regional alignments in this Amendment.

Table 3: Existing Flood Control Facilities Incorporated by the Park Highlands West Amendment as Regional Alignments

ID / River Mile	Status	Facility Description	Length (ft)	Flow (cfs)

Project Total:			**$1,107**	**$805**	**$7,047**	**$8,859**	**$6,848**
Park Highlands West Amendment Category A Facilities Total Cost:			**$1,477**	**$1,182**	**$10,408**	**$13,067**	**$10,101**

*As requested by CCRFCD, a 0.773 factor is applied to the total cost.

Table 5 summarizes a comparison of estimated costs for Category A facilities affected by this Amendment.

Table 5: Comparison of Category A Flood Control Facilities – Park Highlands West Amendment vs. 2013 MPU

Park Highlands West Amendment						2013 CCRFCD MPU					
ID / River Mile	Status	Facility Description	Length (ft)	Flow (cfs)	Adjusted* Total Cost ($ x 1000)	ID / River Mile	Status	Facility Description	Length (ft)	Flow (cfs)	Total Cost ($ x 1000)
AVHR	AVIARY - HORSE					GTEA	GRAND TETON DRIVE CHANNEL EAST				
0000	P1	72" RCP	1,010	165	$811						
0020	P1	66" RCP	1,580	165	$1,167						
0075	P1	60" RCP	1,010	165	$696						
0094	P1	12' X 3' RCB	460	137	$578						
			Sum Cost ($ x 1000)		$3,252				Sum Cost ($ x 1000)		$0
GTEA	GRAND TETON DRIVE SYSTEM EAST					GTEA	GRAND TETON DRIVE CHANNEL EAST				
0141	P1	53" Orifice, 72" RCP	1,450	226	$921						
0168	P1	1,697 cfs Spillway	-	1,697	$233						
0169	P1	170 ac-ft Park Highlands West Detention Basin	-	1,230	$856						
0192	P1	14' X 7' RCA	340	1,172	$586						
0198	P1	12' X 7' RCA	1,980	1,020	$3,036						
0236	P1	12' X 5' RCB	750	936	$1,216						
			Sum Cost ($ x 1000)		$6,848				Sum Cost ($ x 1000)		$0
			Park Highlands West Amendment Category A Facilities Total Cost		$10,101				2013 CCRFCD MPU Equivalent Category A Facilities Total Cost		$0

*As requested by CCRFCD, a 0.773 factor is applied to the total cost.

In review Table 5, there are no equivalent facilities listed for the 2013 MPU; hence the 2013 MPU cost is $0 for Category A facilities. The AVHR facilities listed in Table 5 are new facilities being incorporated into the 2013 MPU. The GTEA facilities listed in Table 5 are new facilities associated with a re-alignment and are classified as Category B facilities in the 2013 MPU.

5.3 Category B Facilities

As part of this Amendment, one Category B facility is being modified. Table 6 provides a detailed cost summary of the revised Category B facilities presented in this Amendment.

Table 6: Detailed Cost Estimation Summary for Park Highlands West Amendment Category B Facilities

ID / River Mile	E/P	Facility Description	D&A Cost ($ x 1000)	R/W Cost ($ x 1000)	Const. Cost ($ x 1000)	Total Cost ($ x 1000)	Adjusted* Total Cost ($ x 1000)
FMEA		FARM ROAD CHANNEL EAST					
0000	P1	10' X 5' RCB	$89	$71	$634	$793	$612
Project Total:			$89	$71	$634	$793	$612
Park Highlands West Amendment Category B Facilities Total Cost:			$89	$71	$634	$793	$612

*As requested by CCRFCD, a 0.773 factor is applied to the total cost.

Table 7 summarizes a comparison of estimated costs for Category B facilities affected by this Amendment. Note the following regarding Category B facilities addressed by this Amendment:

- The cost for the GTEA alignment as has been substantially decreased because of a new alignment.
- The cost of the newly proposed GTEA alignment has shifted to Category A as requested by CCRFCD.

Table 7: Comparison of Category B Flood Control Facilities – Park Highlands West Amendment vs. 2013 MPU

Park Highlands West Amendment						2013 CCRFCD MPU					
ID / River Mile	Status	Facility Description	Length (ft)	Flow (cfs)	Adjusted* Total Cost ($ x 1000)	ID / River Mile	Status	Facility Description	Length (ft)	Flow (cfs)	Adjusted* Total Cost ($ x 1000)
GTEA	GRAND TETON DRIVE SYSTEM EAST					GTEA	GRAND TETON DRIVE CHANNEL EAST				
						0000	P0	12' X 8' RCAP	4,927	1,283	$8,313
						0093	P0	12' X 8' RCAP	3,600	1,283	$6,074
						0161	P0	12' X 8' RCAP	5,385	1,283	$9,085
						0263	P0	12' X 8' RCAP	4,435	1,174	$7,483
						0347	P0	12' X 8' RCAP	452	1,009	$762
						0355	P0	14' X 6' RCB	274	1,009	$529
						0360	P0	6' X 6' RCB	2,650	291	$3,284
				Sum Cost ($ x 1000)	$0					Sum Cost ($ x 1000)	$35,530
FMEA	FARM ROAD CHANNEL EAST					FMEA	FARM ROAD CHANNEL EAST				
0006	P0	10' X 5' RCB	500	800	$612	0006	P0	7' X 5' RCB	500	714	$474
				Sum Cost ($ x 1000)	$612					Sum Cost ($ x 1000)	$474
				Park Highlands West Amendment Category B Facilities Total Cost	$612					2013 CCRFCD MPU Equivalent Category B Facilities Total Cost	$36,004

*As requested by CCRFCD, a 0.773 factor is applied to the total cost.

The GTEA facilities listed in Table 7 are being replaced with the new facilities associated with a re-alignment and are classified as Category A facilities in the Amendment as requested by CCRFCD. Therefore, no equivalent facilities listed for the GTEA facility and hence the GTEA cost is $0 for Category B facilities. As previously discussed, this Amendment proposes to revise one facility within the Villages at Tule Springs community, facility FMEA 0006. Table 7 demonstrated that there is an increase in cost to facility FMEA as compared to the 2013 MPU.

5.4 Total Construction Costs

In comparing the flood control facility costs identified in Tables 5 and 7, the total estimated costs for the proposed changes by the Park Highlands West Amendment have been summarized in Table 8.

Table 8: Total Cost Comparison for Park Highlands West Amendment Facilities

Type	Park Highlands West Amendment Cost ($ x 1000)	2013 CCRFCD MPU Cost ($ x 1000)
Category A	$10,101	$0
Category B	$612	$36,004
Grand Total	***$10,713***	***$36,004***

Table 8 demonstrates that the overall cost of flood control facility changes proposed by the Park Highlands West project is $25.3 million less than planned for in the 2013 MPU. It is acknowledged that the estimated cost to construct Category A flood control facilities is greater than anticipated in the 2013 MPU. However, of the $10.1 million Category A facility construction costs of outlined for the Amendment, it is anticipated that only $3.2 million (for proposed AVHR infrastructure) will require public funding. The remaining $6.8 million in construction cost of the Category A facilities along Grand Teton and through the Park Highlands West property (proposed GTEA infrastructure) are anticipated to be privately funded as part of the Park Highlands West project. Although, one existing Category B was upsized as part of this Amendment, there is an overall decrease to Category B cost as a result of shifting the proposed Park Highlands West improvements from Category B to Category A facilitates as requested by CCRFCD.

6 CONCLUSIONS & RECOMMENDATIONS

This Amendment recommends hydrologic and facility revisions to the 2013 MPU for flood protection of the future master planned community identified as Park Highlands West. The proposed flood protection plan for the Park Highlands West property has added, removed and realigned regional facilities in its vicinity. However, the total cost of regional drainage facilities has been reduced by $25.3 million from the estimated cost reported in the 2013 MPU.

This Amendment is in conformance with the approved Master Study, Update Master Study and Master Update 2 as well as NRS 543.597. CNLV is considered the applicant for formal adoption of this Amendment. All hydrologic and hydraulic analyses prepared by this

Amendment are in conformance with CCRFCD criteria outlined in the 2013 MPU. These proposed facilities do not adversely affect the continued implementation of the MPU.

This Master Plan Amendment sets forth the most effective structural and regulatory means for correcting existing problems of flooding in the area and dealing with the probable effects of future development (NRS 543.590[3]). It is recommended that this Amendment be adopted, to conform to the District's mission to *"...improve the protection of life and property for existing residents, future residents, and visitors from the impacts of flooding."*

Denotes revised/added facility by the Park Highlands West Amendment

Denotes no change in facility but flow change tracked by the Park Highlands West Amendment

Denotes no change to facility or flow change by the Park Highlands West Amendment

** The HEC-1 node shown identifies the controlling concentration point for the associated facility and is located upstream of this facility due to decreasing peak flow with increasing tributary area caused by storm distribution transitions, depth area reduction factors, or attenuation of flow from routing.*

*** As-built or design slopes were used when available. All other slopes are based on existing topography. The user should verify the facility slope listed prior to performing any facility specific analysis.*

^ For parallel facilities, the existing facility flow equals its normal depth capacity, and the proposed parallel facility flow equals the remaining flow (i.e., HEC-1 Node flow = existing facility normal depth capacity + proposed parallel facility flow).

[1] K = 0.0132 (CN) - 0.39
[2] A = Area/640
[3] Ti = (1.8 (1.1-K) L^0.5)/S^0.33
[4] For Existing Conditions: V1 = 14.8 * (S/100)^0.5
For Developed Conditions: V1 = 20.2 * (S/100)^0.5
[5] For Existing Conditions: V2 = 29.4 * (S/100)^0.5
For Developed Conditions: V2 = 30.6 * (S/100)^0.5
[6] Tt = L/(60*V)
[7] Tc = Ti + Tt
[8] Total L = Initial L + Travel L
[9] Tc = (L/180) + 10
[10] Tlag = (0.6*Tc)/60
[11] Min Tlag =0.05

Note: For Travel Time Calcs: V1 applies to first 500 feet and V2 applies to remaining distance.

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL   LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL   LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL   LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL   LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL   LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

APPENDIX C

Facility Sizing Tool Output

Lower Northern Las Vegas Wash Watershed Facility Sizing Tool - Version 9a

Input data in yellow columns. You may cut and paste any data.

Normal Depth:
To calculate the proposed facility height (H or d) required to convey the HEC-1 flow, press <control d> or highlight a cell in the correct line and pick the "Calculate Height" button. Not required for existing facilities.

To calculate the maximum capacity of an existing facility, press <control q> or highlight a cell in the correct line and pick the "Calculate Capacity" button. Not required for proposed facilities.

Lower Northern Las Vegas Wash Watershed Facility Sizing Tool - Version 9a

Input data in yellow columns. You may cut and paste any data.

Normal Depth:
To calculate the proposed facility height (H or d) required to convey the HEC-1 flow, press <control d> or highlight a cell in the correct line and pick the "Calculate Height" button. Not required for existing facilities.

To calculate the maximum capacity of an existing facility, press <control q> or highlight a cell in the correct line and pick the "Calculate Capacity" button. Not required for proposed facilities.

Lower Northern Las Vegas Wash Watershed Facility Sizing Tool - Version 9a

Input data in yellow columns. You may cut and paste any data.

Normal Depth:
To calculate the proposed facility height (H or d) required to convey the HEC-1 flow, press <control d> or highlight a cell in the correct line and pick the "Calculate Height" button. Not required for existing facilities.

To calculate the maximum capacity of an existing facility, press <control q> or highlight a cell in the correct line and pick the "Calculate Capacity" button. Not required for proposed facilities.

Lower Northern Las Vegas Wash Watershed Facility Sizing Tool - Version 9a

Input data in yellow columns. You may cut and paste any data.

Normal Depth:
To calculate the proposed facility height (H or d) required to convey the HEC-1 flow, press <control d> or highlight a cell in the correct line and pick the "Calculate Height" button. Not required for existing facilities.

To calculate the maximum capacity of an existing facility, press <control q> or highlight a cell in the correct line and pick the "Calculate Capacity" button. Not required for proposed facilities.

Land Use Index Numbers & Curve Number Matrix

Table 4-2 Land Use Categories

Land Use Index Number	Description - Typical Land Uses	Impervious (%)	Open Landscaped Good Condition (%)	Open Desert Shrub Poor Condition *Natural Desert Landscaping* (%)
	Drought Ordinance Not Applied			
1	Undeveloped Land, Open Desert	0	0	100
2	Parks, Golf Courses	5	85	10
3	Rural, 0.5-1 units per acre (uses 1 unit/acre)	20	20	60
4	Low-Density Residential, 1-2 units per acre (uses 2 units/acre)	25	40	35
5	Medium-Density Residential, 2-4 units per acre (uses 3 units/acre)	29	71	0
6	High-Density Residential, 4-8 units per acre (uses 6 units/acre)	62	38	0
7	Public Facility and Residential, 8- 12 units/acre	72	28	0
8	Very High-Density Residential, 12 units/acre or more	85	15	0
9	Commercial, Retail, Casino, High Rise Condominiums	90	10	0
10	Light Industrial	70	15	15
11	Heavy Industrial	85	8	7
12	Schools	50	50	0
13	Lakes	0	0	0
	Drought Ordinance Applied			
14	Low-Density Residential, 1-2 units per acre (uses 2 units/acre)	25	20	55
15	Medium-Density Residential, 2-4 units per acre (uses 3 units/acre)	29	35	36
16	High-Density Residential, 4-8 units per acre (uses 6 units/acre)	62	19	19
17	Public Facility and Residential, 8- 12 units/acre	72	14	14
18	Very High-Density Residential, 12 units/acre or more	85	0	15
19	Commercial, Retail, Casino, High Rise Condominiums	90	0	10
20	Light Industrial	70	0	30
21	Heavy Industrial	85	0	15
22	Schools	50	30	20

The land use data used with the 2008 MPU is shown on the H-Maps of Volume 2. **Figure 4-1** shows the geographic comparison between the 2008 and 2002 MPU land use coverages in terms of percent imperviousness. The increase or decrease in impervious area represents an increase or decrease in the runoff potential for a given area.

Lower Northern Las Vegas Wash Watershed Discussion

Chapter 7
Lower Northern Las Vegas Wash Watershed

7.1. Introduction

This chapter presents the information developed for the 2008 MPU for the Lower Northern Las Vegas Wash Watershed, which is located in the north portion of the Las Vegas Valley. As mentioned in **Section 6.1**, the 2002 MPU's Northern Las Vegas Wash Watershed has been divided into two new hydrographic planning areas (watersheds). Lower Northern Las Vegas Wash Watershed contains the area downstream of the ULVWDB and the Las Vegas Wash Middle Branch at Ann Road. The City of North Las Vegas is responsible for programming flood control funds for Lower Northern Las Vegas Wash Watershed.

This watershed is primarily within the City of North Las Vegas jurisdiction; however, it includes portions of unincorporated Clark County. This watershed is bounded on the west by Decatur Boulevard and Allen Lane, on the north by the Sheep Mountains, on the east by Losee Road and Nellis Boulevard, and on the south by the Las Vegas Wash. This watershed discharges directly into the Las Vegas Wash. Please refer to **Figure 1-1** for the location of this watershed.

There has been a rapid growth in the middle portion of this watershed between Centennial Parkway and Grand Teton Drive. Although the rate of development has slowed recently, it is anticipated that the growth is likely to continue in this area. The mountainous areas in the northern portion of the watershed are expected to remain undeveloped as it is reserved federal land. The majority of the remaining portion of this watershed, south of Centennial Parkway, is developed.

The total area of the Lower Northern Las Vegas Wash Watershed is approximately 106 square miles. Drainage facilities within the watershed consist primarily of detention basins connected by conveyance facilities.

Major modifications and additions of facilities to the Master Plan within this watershed are located primarily at the following locations: 1) between the beltway and Grand Teton Drive and 2) in the southeast portion of the watershed along Lamb Boulevard and Nellis Boulevard.

7.2. Drainage Characteristics

Flows from the steep mountain slopes exit onto alluvial fans extending across the entire southern portion of the watershed. Drainage patterns in the lower portion of the Lower Northern Las Vegas Wash Watershed are generally from northwest to southeast.

7.3. Master Plan Progress

Significant progress has been made on the implementation of the Master Plan since the 2002 MPU through the construction of flood control facilities. Construction of approximately 10 miles of conveyance facilities and the construction of 1 peaking basin have been completed since the 2002 MPU. Major flood control facilities constructed since the 2002 MPU include the following:

- Construction of the Cheyenne Peaking Basin and associated conveyance system (Las Vegas Wash- Middle) from Civic Center Drive to Cheyenne Avenue
- The Las Vegas Wash – Middle facilities from Alexander Road to the I-15 highway
- The Elkhorn Road Channel East facilities along the beltway from Aviary Way to just east of Aliante Parkway
- The Upper Las Vegas Wash facilities from the North Las Vegas Detention Basin to Craig Road
- The Centennial Parkway Channel East facilities along Centennial Parkway from Revere Street to its confluence with the Upper Las Vegas Wash facilities
- The Tropical Road Channel East facilities along Tropical Parkway from Commerce Street to 5th Street
- The Las Vegas Wash – Simmons facilities along Simmons Street from Centennial Parkway to its confluence with the Las Vegas Wash
- The Las Vegas Wash – N Channel facilities from the I-15 highway to Gowan Road
- The 5th Street Collector facilities from just north of Deer Springs Way to 5th Street
- The Las Vegas Wash – Losee facilities from just north of Craig Road to its confluence with the Upper Las Vegas Wash facilities

In total, approximately 33 miles of conveyance facilities and 3 detention basins have been constructed to date in the Lower Northern Las Vegas Wash Watershed.

7.4. Hydrologic Analysis

The hydrologic analysis and models completed with the 2002 MPU served as the basis for the 2008 MPU hydrologic analysis and modeling effort. The 2002 MPU subbasin delineations for a large portion of this watershed were based on the City of North Las Vegas North Neighborhood Flood Control Master Plan. The 2002 MPU hydrologic parameters used in the models were reviewed and updated to incorporate the changes in criteria and methodology described in **Section 4.3**, which primarily include application of the drought ordinance and changes in land use density. The hydrologic parameters were revised to incorporate all new data collected and/or developed for the 2008 MPU. The major drainage reports and technical drainage studies reviewed and incorporated into the hydrologic analysis are tabulated in **Table 7-1**.

Table 7-1 Lower Northern Las Vegas Wash Watershed Major Hydrologic Studies

1	CONCEPTUAL DRAINAGE STUDY FOR NORTH LAS VEGAS 600-ACRE SITE (GCW, 2006)
2	CONCEPTUAL DRAINAGE STUDY FOR NORTH LAS VEGAS 2074-ACRE SITE (GCW, 2006)
3	TDS FOR GRAND TETON DRIVE STORM DRAIN AND AREA 1 ROADWAY IMPROVEMENTS (GCW, 2006)

The southern watershed boundary was revised since the 2002 MPU to include the area northeast of the Las Vegas Wash from Pecos Road to Nellis Boulevard. This area was part of the Central Watershed in the 2002 MPU. Because of this revision, the new watershed boundary between Lower Northern Las Vegas Wash Watershed and Central Watershed is along Las Vegas Wash.

The same hydrologic models (CWEST, WEST, CCWEST and CLVMD) described in **Section 6.4** were used to size facilities within this watershed.

7.5. Flood Control Facility Plan

The final flood control facility plan is generally the same as the 2002 MPU. Problem areas and major revisions to the plan since 2002 MPU are described below.

Southeast Lower Northern Las Vegas Wash Watershed Area

The following proposed Category A facilities were added in the southeast portion of the Lower Northern Las Vegas Wash Watershed:

- A proposed storm drain system (Las Vegas Wash – Lamb "LVLA") under Lamb Boulevard from Cheyenne Avenue to the Las Vegas Wash.
- A proposed storm drain system (Las Vegas Wash – Nellis "LVNE") under Nellis Boulevard from Alto Avenue to Bonanza Road, and then west along Bonanza Road to discharge into Las Vegas Wash.

These two facilities were added to help convey the 100-year flows in the southeast part of the watershed.

Cheyenne Peaking Basin

It was determined that the existing Cheyenne Peaking Basin (LVMD 1645) does not have adequate storage volume to contain the 100-year ultimate condition flows. To prevent spillway operation, it is proposed to raise the spillway crest elevation from 1886 feet to 1887 feet. By doing this, the storage volume of the Cheyenne Peaking Basin is upgraded from 456 acre-feet to 482 acre-feet. It appears that based on existing condition land use, the Cheyenne Peaking Basin has adequate storage capacity based on the ongoing Las Vegas Wash LOMR study hydrology.

North Las Vegas Detention Basin

The North Las Vegas Detention Basin (LVUP 0405) is proposed to be expanded to a capacity of 2,215 acre-feet. In the 2002 MPU, this detention basin was proposed to be upgraded to 1,650 acre-feet.

North Las Vegas 2074-Acre Site Facilities

Necessary revisions are made to the facility plan to incorporate the facility changes per the Conceptual Drainage Study for North Las Vegas 2074 – Acre Site dated October 2006. Per this study, the 2002 MPU proposed Farm Road Channel East (FMEA) facilities are removed from the facility plan. The 2074-Acre Site is located between the beltway and Grand Teton Drive east or Clayton Street and west of Losee Road

Freeway Channel

A proposed channel and storm drain system is added along I-15 (Freeway Channel "LV15") to replace the existing channel and storm drain system from Carey Avenue to Gowan Road. It was determined that the above-mentioned existing flood control facilities along I-15 do not have adequate capacity to convey the 100-year ultimate condition flows.

In addition to the above information, **Table 7-2** summarizes the analysis of all the existing and proposed detention basins within the Lower Northern Las Vegas Wash Watershed.

Table 7-2 Lower Northern Las Vegas Wash Watershed Detention Basin Summary Table

Name of Detention Basin	ID MILE	Peak Inflow (cfs)	Existing Storage @ Spillway (ac-ft)	Expansion Required (ac-ft)	Total Storage Volume (ac-ft)	Spillway Elevation (ft)	Stage (ft)	Freeboard (ft)
Cheyenne Peaking Basin[1]	LVMD 1645/1646	11998	456	26	482	1887.00	1886.76	0.24
Lower Las Vegas Wash	LVMD 2050	6729	700	--	700	2115.50	2103.81	11.69
North Las Vegas	LVUP 0405/0406	12887	1435	780	2215*	2134.00	2132.99	1.01

* Total Storage Volume accounts for Sediment Load

Existing detention basin

Proposed detention basin

Existing detention basin with proposed expansion

Notes: 1) The expansion for the Cheyenne Peaking Basin was acquired by raising the spillway from elevation 1886' to 1887'.

7.6. Environmental Issues

Potential habitat exists for the Las Vegas bearpoppy, Las Vegas buckwheat, mesquite/acacia, Mojave desert tortoise, western chuckwalla, banded Gila monster, burrowing owl, sensitive bat species, and Cacti and Yucca species. BLM Area of Critical Environmental Concern occurs in the southeast portion of this watershed. Sensitive cultural and paleontological resources could also potentially occur in this area (BLM 2002, NNHP 2002, BLM 2004, BLM and USACE 2004b).

7.7. Facility Cost Estimates

Cost estimates for all facilities have been derived using the Cost Estimation Tool described in **Section 4.5**. Construction cost estimates for proposed facilities have been divided into Category A and Category B, as described in **Section 4.5.2**. The total estimated current value of existing facilities and total estimated construction cost of proposed Category A and B facilities in the Lower Northern Las Vegas Wash Watershed are as follows:

Estimated Value Existing Facilities	=	$269,908,000
Estimated Construction Cost Proposed Category A	=	$225,301,000
Estimated Construction Cost Proposed Category B	=	$126,760,000

Table 7-3 shows the current estimated value of each existing facility in the Lower Northern Las Vegas Wash Watershed. **Table 7-4** shows the construction cost estimates for each proposed Category A facility in the Lower Northern Las Vegas Wash Watershed. **Table 7-5** shows the construction cost estimates for each proposed Category B facility in the Lower Northern Las Vegas Wash Watershed.

** The HEC-1 node shown identifies the controlling concentration point for the associated facility and is located upstream of this facility due to decreasing peak flow with increasing tributary area caused by storm distribution transitions, depth area reduction factors, or attenuation of flow from routing.*

*** As-built or design slopes were used when available. All other slopes are based on existing topography. The user should verify the facility slope listed prior to performing any facility specific analysis.*

^ For parallel facilities, the existing facility flow equals its normal depth capacity, and the proposed parallel facility flow equals the remaining flow (i.e., HEC-1 Node flow = existing facility normal depth capacity + proposed parallel facility flow).

** The HEC-1 node shown identifies the controlling concentration point for the associated facility and is located upstream of this facility due to decreasing peak flow with increasing tributary area caused by storm distribution transitions, depth area reduction factors, or attenuation of flow from routing.*

*** As-built or design slopes were used when available. All other slopes are based on existing topography. The user should verify the facility slope listed prior to performing any facility specific analysis.*

^ For parallel facilities, the existing facility flow equals its normal depth capacity, and the proposed parallel facility flow equals the remaining flow (i.e., HEC-1 Node flow = existing facility normal depth capacity + proposed parallel facility flow).

Re: Master Drainage Study Addendum#2 - Park Highlands West (AKA North Las Vegas 600-Acre Site)
CNLV No. 46257

Dear Mr. Failla and Mrs. Collins:

This letter supersedes the letter dated April 22, 2014. The CNLV staff has reviewed the above referenced study, dated May 29, 2013, Addendum #1, dated October 28, and Addendum #2, dated February 11, 2014 and found it to meet the minimum accepted standards for the technical drainage study. This acceptance is contingent upon the following conditions:

1. Concurrence must be obtained by the Clark County Regional Flood Control District (CCRFCD) due to the proposed improvement's proximity to a Regional Flood Control Facilities. Please submit a copy of this drainage study and all addenda to CCRFCD upon acceptance from CNLV.

2. Since this study is proposing to add, remove, and revise various regional flood control facilities, a CCRFCD Master Plan Amendment must be submitted and completely processed by the Engineer once this study, the Technical Drainage Study for Park Highlands Grand Teton Regional Flood Control Facility (DB Study), and the Master Drainage Study for Park Highlands East have been reviewed and approved by CNLV, CLV, and CCRFCD.

   Also, please note that the proposed detention must be fully constructed and maintained by the developer until the Master Plan Amendment has been approved and that CNLV receives maintenance funding from the Regional Flood Control District for the maintenance operation of the detention basin

3. Approval from the City of Las Vegas (CLV) will be required since the project is adjacent to the jurisdictional boundary and will construct storm drain improvements within CLV's public ROW.

4. Please note that no onsite development will be allowed until either a required interim or a permanent regional flood control facility are fully constructed along Grand Teton.

5. Please note that prior to approving the Improvement Drawings for the Park Highlands Grand Teton Regional Flood Control Facility (DB Study) , all previously approved Improvement Drawings on CNLV files in this master plan must be revised to reflect the changes from the approved DB Study.

6. Please note that any changes to the proposed land-use or drainage patterns as shown in this study will require the Engineer to provide a drainage study update to this master drainage study.

7. Please coordinate with Duane McNelly, Development and Flood Control Project Leader, when submitting Improvement Drawings for this project. Mr. McNelly can be reached at 633-2312.

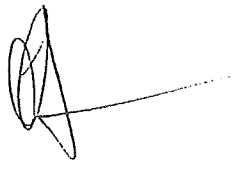
Please be advised that all land surface area disturbances over 1 acre and/or adjacent to a water way must submit a "Notice of Intent" to discharge to the Nevada Division of Environmental Protection, which certifies that a stormwater pollution prevention plan has been developed and is maintained on site. For more information, including forms and applications, see http://ndep.nv.gov/bwpc/storm01.htm.

Acceptance of this drainage study update does not imply approval of the Improvement Drawings and calculations associated with the drainage for this site. A detailed review of the drawings will be performed by staff during the improvement plan review process.

Any future changes in the proposed design (or design assumptions) as outlined in the approved drainage study and the attached preliminary plans which affect drainage must be addressed in a Drainage Study Amendment and accepted by the CNLV Development and Flood Control Section. Additionally, conditional acceptance of a drainage study is valid for a period of one (1) year. If the proposed construction has not been completed in that time period, CNLV reserves the right to require additional conditions and/or submission and acceptance of a complete drainage study update prior to further construction of a project.

CNLV, its officials, or employees assume no liability for information, data, calculations and conclusions presented by the consulting engineers. We, therefore, make no warranties, either expressed or implied, in conducting this review. If you have any questions concerning this matter, please contact me at 633-1932.

Sincerely,



Dan Le, P.E., CFM
Senior Engineer
Development and Flood Control Division

CITY OF LAS VEGAS INTER-OFFICE MEMORANDUM			DATE: June 3, 2014
TO: Land Development Services Department of Public Works			FROM: Albert Sung, P.E. for Flood Control Project Engineer Department of Public Works
SUBJECT:	Drainage Study for: Park Highlands West (Project in CNLV) – AKA North Las Vegas 600-Acre Site		COPIES TO: Slater Hanifan Group (SHG)
Cross Streets:	Grand Teton Blvd. & Decatur Blvd.		Crescent Bay Holdings
File Number:	F:\Depot\DSMemos\DS4670A.doc		Bart Anderson, P.E., DevCo
Parcel Number:	124-07-499-001 & More		CCRFCD
Zoning Action:	N/A		CNLV
FEMA Flood Zone	YES	NO X	
Proposed Storm Drain	YES X	NO	

HISTORY	DATE RECEIVED	DATE REVIEWED	COMMENTS	REVIEW FEES	FEES PAID Payment Trn #
1st Submittal	4/24/2014; 5/8/2014 & 5/19/2014	6/2/2014	Approved	$400.00	355211: $400
			TOTAL FEES (LDDRS):	$800.00	$800.00

REMARKS: Master Plan Amendment Required.

1st Submittal: Development split into two projects.

The Drainage Study for the subject project has been reviewed and:

	is approved subject to conformance to all City standards and the following conditions:
	must be resubmitted or supplemented including the following:
	is conditionally approved subject to Clark County Regional Flood Control District concurrence.
X	is conditionally approved subject to Clark County Regional Flood Control District **Master Plan Amendment Approval.**

***City of Las Vegas Flood Control* staff has reviewed the Technical Drainage Study, Addendum #1 and Addendum #2 of the subject development in the *City of North Las Vegas*. *City of Las Vegas* concurs with the acceptance of the drainage study by the *City of North Las Vegas Department of Public Works*. The review of this project was limited to issues of flood control significance to the *City of Las Vegas*.**

1. Study flow rates at the Grand Teton facility are based upon a *Clark County Regional Flood Control District Master Plan Amendment (MPA)* being adopted. Future MPU facilities will significantly impact these proposed facility improvements without the approval of the MPA. If the MPA is not approved, the drainage studies and improvement plans must be updated to accommodate the flow impacts from the adopted Master Planned Facilities.

2. Approval is predicated upon the construction of the Grand Teton Regional Flood Control Facility improvements at the west side of the intersection of Decatur Boulevard and Grand Teton Drive as shown on the improvement plans prepared by SHG dated 11-12-2013.

NOTE: Any future changes to the proposed design (or design assumptions) as outlined in the approved drainage study and attached preliminary grading plan which affect drainage must be addressed in a Drainage Study Amendment and accepted by the *City of Las Vegas Flood Control Section.* Additionally, conditional acceptance of a drainage study is valid for a period of one (1) year. If the proposed construction has not been completed in that time period, the *City of Las Vegas* reserves the right to require additional conditions and/or submission and acceptance of a complete drainage study update prior to further construction of a project.

NOTE: Please be advised that all land surface area disturbances over 1 acre or any area adjacent to a water way must submit to the *Nevada Division of Environmental Protection* a "Notice of Intent" to discharge that certifies a stormwater pollution prevention plan has been developed and is maintained on site; for inclusion in the Stormwater General Permit No. NVR100000. A phased construction unit in a contiguous subdivision is considered under construction until all stripped or disturbed surface areas have been covered by paving, building construction or planting. For more information, including forms and applications see http://ndep.nv.gov/bwpc/storm01.htm or call (775) 687-9429.

North Las Vegas, NV 89030

DISTRICT CONCURRENCE: **MASTER DRAINAGE STUDY FOR PARK HIGHLANDS WEST (AKA NORTH LAS VEGAS 600 ACRE SITE) (CNLV # 46257) (RFCD No. 14-9310)**

Dear Mr. Le:

Clark County Regional Flood Control District (District) reviewed Technical Drainage Study dated May 29, 2013, Addendum No. 1 dated October 28, 2013, and Addendum No. 2 dated February 11, 2014 for above-mentioned project as submitted by SLATER HANIFAN GROUP. In addition, District is in receipt of the Conditional Letter of Acceptance from City of North Las Vegas Public Works dated April 22, 2014.

District concurs with acceptance of this Technical Drainage Study by City of North Las Vegas Public Works with the following conditions:

1. It is noted that the Engineer will update the "Park Highlands - Grand Teton Regional Flood Control Facility" drainage study to reflect the removal of the park facility. Revisions in that study may impact this Master Drainage Study. All affected studies must be updated to reflect the current design of the Park Highlands development.

2. Per table revise color and linetype of E2 – E 4 to match legend for facilities to be removed/abandoned.

3. Based on the current design, low/nuisance flow is conveyed along the existing golf course. Consider a low/nuisance flow facility from the existing 10'x5' RCA (facility E50) to the existing storm drain system on Elkhorn Road (E83-E88).

District's review of this project was limited to issues of Regional Flood Control Significance as defined in *Uniform Regulations for the Control of Drainage*.

Please be aware that as additional information becomes available and/or restudies of Flood Insurance Studies are performed, information submitted by SLATER HANIFAN GROUP may be superseded. Compliance with regulatory elements and design standards specified in *Uniform Regulations for the Control of Drainage* does not imply a guarantee that properties will be free from flooding or flood damage. The District, its officials, or employees assume no liability for information, data, or conclusions presented by consulting engineers. We, therefore, make no warranties, either expressed or implied, in conducting this review.

1 INTRODUCTION

1.1 Overview & Study Purpose

Crescent Bay Holdings, Inc. is proposing a 600 ± acre master planned community within the City of North Las Vegas, Nevada (CNLV) and directly adjacent to the City of Las Vegas, Nevada (CLV). The site is located near the southeast corner of Grand Teton Drive and Decatur Boulevard. The master planned community is identified as *Park Highlands West*. The Park Highlands West master planned community consists primarily of residential development, with some parcels appropriated for commercial development, parks and schools. The master plan also addresses development of roadways, and municipal and flood control improvements.

A previously approved Conceptual Drainage Study (by others) exists for the project site. See Section 1.2 of this report for further discussion. However, since approval of previous study, revisions have been made both onsite and offsite that impact the Park Highlands West project site. The purpose of this study is to address the revisions and serve as a replacement to the previous Conceptual Drainage Study (by others). The Master Drainage Study provides an overall conceptual hydrologic and hydraulic analysis for the project site in order to provide flood control recommendations to protect the property from onsite and offsite runoff in accordance with local storm water criteria. The study addresses the following:

- Research of previous drainage studies for the project area.
- An inventory of existing storm water facilities in the vicinity.
- Determination of FEMA flood plain designation for the project site.
- Identification of existing, proposed and/or future CCRFCD facilities in the vicinity of the project site.
- Interim and ultimate condition offsite drainage patterns and determination of 10-year and 100-year peak flow rates.
- Ultimate condition onsite drainage patterns and determination of 10-year and 100-year peak flow rates.
- Allowable discharge restrictions at downstream locations based on existing condition peak flows and/or peak flows established by prior studies.
- Conceptual design recommendations for master drainage infrastructure to control onsite and offsite stormwater runoff.

Please note that this study constitutes a master drainage study for the proposed site for use in site planning and conceptual design. No improvements are proposed at this time; only designation of onsite land use and drainage patterns, as well as recommendations for future drainage infrastructure. Future technical drainage studies and/or update studies will address development of individual parcels and drainage infrastructure when improvements are proposed.

1.2 Research of Previous Drainage Studies

The Park Highlands West project site was conceptually analyzed by a previously approved conceptual drainage study by others. The previously approved conceptual study and relevant update studies have been reviewed and portions have been utilized for reference

in preparation of this study. The previously approved conceptual study and relevant update studies are as follows:

1) *Conceptual Drainage Study for the North Las Vegas 600-Acre Site* (by G.C. Wallace, hereafter referred to as the CDS, CNLV No. 24576) approved by the CNLV on June 14, 2006.

2) *Update No. 1 to the Conceptual Drainage Study for the North Las Vegas 600-Acre Site* (by G.C. Wallace, hereafter referred to as the CDS Update No. 1, CNLV No. 27888) approved by CNLV on January 17, 2007.

3) *Update No. 2 to the Conceptual Drainage Study for the North Las Vegas 600-Acre Site* (by G.C. Wallace, hereafter referred to as the CDS Update No. 2, CNLV No. 28463) approved by CNLV on February 28, 2007.

In addition to the previous CDS and CDS Updates for the site, several technical studies (by others) have also been approved for the site. The Park Highlands West project site was divided into several "areas" (Area 1 thru Area 9) per the previously approved CDS. Approved technical drainage studies and improvement plans for each of the areas (hereafter generally referred to as the Area Studies) have been prepared for the site addressing technical design of each of the individual areas within the site. Please see Exhibit N located in Appendix A for reference to the areas. With these approved Area Studies, a large part of the onsite flood control improvements, including onsite storm drain and drop inlets, as well as rough graded roadways, have been constructed and are considered existing per this Master Drainage Study. See Section 1.8 for more detailed discussion of each of the Area Studies and improvement plan sets utilized for reference in preparation of this Master Drainage Study.

Since approval of the CDS and CDS Updates, as well as the Area Studies, several changes have been made both onsite and offsite that impact the Park Highlands West project site. Therefore, this Master Drainage Study is submitted to address these revisions and serves as a replacement to the currently approved CDS and CDS Updates associated with this site. The main revisions addressed with this Master Drainage Study include the following:

- Change in site ownership;
- Minor revisions to the site and land use plan resulting in revised onsite hydrologic analysis;
- Revised offsite hydrologic analysis;
- Incorporation of existing onsite storm drain and drop inlets constructed with the currently approved Area Studies;
- Revised CCRFCD Regional Facilities in Grand Teton Drive which include addition of an onsite detention basin at the southeast corner of Grand Teton Drive and Aviary Way, modifications to the CCRFCD Regional Facility in Grand Teton Drive from Decatur Boulevard to Aviary Way, and removal of the CCRFCD Regional Facilities in Grand Teton Drive (from Aviary Way to the Las Vegas Wash) and Decatur Boulevard (from Horse Drive to Grand Teton Drive);
- Revisions to portions of existing onsite storm drain facilities to accommodate the proposed detention basin;

- Addition of the existing CCRFCD Regional Facility in Decatur Boulevard which acts as a cutoff for flow from the west, negating the need for an onsite interim condition hydraulic analysis.

The majority of the revisions listed above have been addressed with a recent technical drainage study entitled *Technical Drainage Study for Park Highlands Grand Teton Regional Flood Control Facility* (by Slater Hanifan Group, hereafter referred to as the DB Study, CNLV No. 45326). This study addressed the revised offsite hydrology, the addition, removal and modifications to CCRFCD Regional Facilities in Grand Teton Drive and Decatur Boulevard and the onsite storm drain revisions related to the addition of the onsite detention basin. However, the DB Study did not address the minor revisions to the site and land use plan which require a re-analysis of ultimate condition onsite hydrology. Therefore, this Master Drainage Study incorporates the revisions proposed in the DB Study, as well as the revisions to the onsite hydrology required due to minor revisions to the site and land use plan.

1.3 Site Description

In the current condition, the Park Highlands West project site is partially undeveloped with sparse desert vegetation, and partially mass graded per the approved Area Studies. The project site is generally bound by Grand Teton Drive alignment to the north, Decatur Boulevard to the west, Dorrell Lane to the south, and Aliante Parkway to the east. The existing Aliante master planned community borders the Park Highlands West site to the east and south. The project site generally drains in a southeasterly direction. A vicinity map, identified as Exhibit A, is included in Appendix A for reference.

Per the Area Studies and site investigation, the majority of onsite storm drain and drop inlets are constructed and considered existing per this Master Drainage Study. The majority of the onsite roadways are rough graded to subgrade. Furthermore, the majority of municipal improvements, including water and sewer are constructed. CNLV has provided an exhibit illustrating the improvements that have been constructed within the Park Highlands West project site thus far and the exhibit has been included for reference in Appendix E.

1.4 FEMA Flood Zone Designation

The proposed project is not located within a FEMA designated Special Flood Hazard Area (SFHA) per review of Flood Insurance Rate Map (FIRM) Panel 32003C1765F, dated November 16, 2011. Exhibit B depicting the project location on the FEMA FIRM panel is included in Appendix A.

1.5 CCRFCD 2008 Master Plan Update

Per the 2008 CCRFCD Master Plan Update (hereafter referred to as the CCRFCD MPU, Reference 1), this project includes facilities identified as future regional facilities. The affected facilities currently depicted in the MPU are identified as GTEA 0360, 0355, 0347, 0263, 0161, 0093 and 0000. Note that per the DB Study various changes to the regional hydrologic analysis, routing patterns and regional facilities are proposed which have been incorporated into this Master Drainage Study. Per coordination with CNLV and CCRFCD, an MPU Amendment is required as part of this project and will be processed subsequent to conditional approval of this Master Study Drainage.

The project site has been identified on the current 2008 CCRFCD MPU Figures F-14 and H-14, identified as Exhibits C and D. The exhibits are included in Appendix A for reference.

1.6 City of North Las Vegas North Neighborhood Study

Existing and future condition drainage maps from the City of North Las Vegas North Neighborhood Study (hereafter referred to as the CNLV NN Study, Reference 2) were reviewed for comparison of peak flows identified by the CNLV NN Study to those proposed by this study at various locations. The exhibits are identified as Exhibits 1E, 2E, 1F and 2F, and are included in Appendix A.

1.7 City of Las Vegas Northwest Neighborhood Study Phase 2

Existing and future condition drainage maps from the City of Las Vegas Northwest Neighborhood Study Phase 2 (hereafter referred to as the CLV NWN Study, Reference 3) were reviewed for comparison of peak flows identified by the CLV NWN Study to those proposed by this study at various locations. The exhibits are identified as Exhibits 1G, 2G, 1H and 2H and are included in Appendix A.

1.8 Reference Studies

This document was prepared in coordination with various relevant documents, studies and improvement plans previously reviewed and approved by CNLV, CLV and CCRFCD. The following drainage studies were utilized in the preparation of this study. Relevant material was reviewed and is considered acceptable for reference with exceptions as noted in this report. Relevant reference material has been included in Appendix F and Appendix G.

1) *Update No. 2 to the Conceptual Drainage Study for the North Las Vegas 600-Acre Site* (by G.C. Wallace, hereafter referred to as the CDS Update No. 2, CNLV No. 28463) has been utilized as reference for the currently approved conceptual facilities for the Park Highlands West site.

2) *Improvement Plans for North Las Vegas 600 Acres Area 2* (by Carter Burgess, hereafter referred to as the Area 2 Plans, CNLV No. 28976) have been utilized to determine geometry and slope of proposed Area 2 roadways, as well as location, size and slopes of existing Area 2 storm drain improvements.

3) *Improvement Plans for North Las Vegas 600 Acres Area 3* (by Carter Burgess, hereafter referred to as the Area 3 Plans, CNLV No. 29254) have been utilized to determine geometry and slope of proposed Area 3 roadways, as well as location, size and slopes of existing Area 3 storm drain improvements.

4) *Improvement Plans for North Las Vegas 600 Acres Area 3 Arch Culvert* (by Slater Hanifan Group, hereafter referred to as the Area 3 Arch Plans, CNLV No. 42173) have been utilized to determine location, size and slope of existing Area 3 storm drain improvements for the facility extending from Farm Road south to the Aliante Golf Course Channel (Concentration Point PT2).

5) *Improvement Plans for North Las Vegas 600 Acres Area 4* (by Carter Burgess, hereafter referred to as the Area 4 Plans, CNLV No. 28978) have been utilized to determine geometry and slope of proposed Area 4 roadways, as well as location, size and slopes of existing Area 4 storm drain improvements.

6) *Improvement Plans for North Las Vegas 600 Acres Area 7* (by Carter Burgess, hereafter referred to as the Area 7 Plans, CNLV No. 29393) have been utilized to determine geometry and slope of proposed Area 7 roadways, as well as location, size and slopes of existing Area 7 storm drain improvements.

7) *Existing Storm Drain Modifications Decatur Boulevard, Las Vegas Wash Middle Branch Storm Drain Improvements, Decatur Boulevard & Elkhorn Road Improvement Plans* (by VTN Nevada, hereafter referred to as the Decatur Facility Plans, CLV No. 16529) have been utilized to confirm that the storm drain connection from Decatur Boulevard storm drain to the onsite storm drain in Virage Park Drive has been removed.

8) *Technical Drainage Study for North Las Vegas 600-Acres Areas 8 and 9* (by G.C. Wallace, hereafter referred to as the Area 8 & 9 Study, CNLV No. 36235) has been utilized to determine geometry and slope of proposed Area 8 and 9 roadways, as well as location, size and slopes of existing and proposed Area 8 and 9 storm drain improvements.

9) *Technical Drainage Study for Grand Teton Regional Flood Control Facility* (by Slater Hanifan Group, hereafter referred to as the DB Study, CNLV No. 45326) has been utilized to determine geometry and slope of proposed Grand Teton Drive improvements, as well as location, size and slopes of proposed Grand Teton Drive storm drain improvements. The DB Study has also been referenced to identify specific parameters relevant to the proposed onsite detention basin for incorporation into hydrologic and hydraulic modeling. Please note that the offsite hydrologic analysis provided herein is identical to that included in the DB Study.

10) *Technical Drainage Study for Nelson Ranch* (by Orion Engineering and Surveying, hereafter referred to as the Nelson Ranch Study, CNLV No. 14854) has been utilized to determine geometry and slope of proposed Grand Teton Drive improvements east of Aviary Way, as well as location, size and slopes of existing storm drain improvements in Grand Teton Drive east of Aviary Way.

11) Update to Conceptual Drainage Study for North Las Vegas 1905 Acre Site (Aliante) (by G.C. Wallace, hereafter referred to as the Aliante Study, CNLV No. 12601) has been referenced to establish the historic drianage patterns for the project site, as well as to establish allowable discharges at downstream concentration points for each of the four (4) discharge locations.

Table 1 summarizes additional drainage studies that are referenced. Review and reference of these studies is primarily relevant to the offsite hydrologic analysis impacting Grand Teton Drive. Specifically, the drainage maps and grading plans were reviewed to determine the drainage patterns (i.e. high points in roadways), drainage basin limits and street slopes. Additionally, some drainage studies were reviewed for the design flow rates in local storm drain facilities. Copies of these drainage studies are included with the electronic files located in Appendix G.

2 METHODOLOGY

2.1 Compliance

The methodologies utilized in the preparation of this study are in compliance with the Clark County Regional Flood Control District's Hydrologic and Drainage Design Manual (CCRFCD Manual, Reference 4) and local entity criteria.

2.2 Hydrologic Modeling

Modeling: The SCS Unit Hydrograph Method (SCS Method) was utilized to determine peak flow rates. The SCS Method utilizes precipitation, drainage area, curve number and lag time parameters to determine peak flow rates. The SCS Method routine within the U.S. Army Corp of Engineer's HEC-1 Flood Hydrograph Package program (version 4.1, June 1998) was utilized to model the drainage subbasins analyzed by this study.

Precipitation, Design Storm Distribution & DARF: Based on the CCRFCD Manual, the design storm shall be the 100-year, 6-hour storm event for regional storm drain, detention basin design and street flow evaluation. The 10-year, 6-hour storm event is also to be evaluated for street flow. The project site and the offsite watershed are located within the McCarran Rainfall Area. The precipitation values utilized for areas within the McCarran Rainfall Area are 1.58 and 2.77 inches for the 10-year and 100-year storm events, respectively. Since the overall watershed is less than 8 square miles, an SDN3 design storm distribution was utilized as referenced from Table 503 of the CCRFCD Manual. Additionally, Depth Area Reduction Factors (DARFs) are applied to the hydrologic analyses. Table 2 summarizes the area associated with each DARF. Note that the ranges are based on Table 502 from the CCRFCD Manual and are identical to the ranges used in

the 2008 Las Vegas Valley MPU. Relevant tables and figures from the CCRFCD Manual have been included in Appendix B.

Table 2: Summary of DARFs

Low Range (sq mi)	High Range (sq mi)	DARF
0.00	0.49	0.990
0.50	0.99	0.975
1.00	1.99	0.950
2.00	2.99	0.925
3.00	3.99	0.915
4.00	4.99	0.908
5.00	5.99	0.903
6.00	6.99	0.895
7.00	7.99	0.885
8.00	8.99	0.875
9.00	9.99	0.865
10.00	10.99	0.857
11.00	11.99	0.850
12.00	15.99	0.832
16.00	19.99	0.804
20.00	29.99	0.765
30.00	39.99	0.725
40.00	49.99	0.695
50.00	59.99	0.672
60.00	69.99	0.656
70.00	79.99	0.640
80.00	89.99	0.624

Land Use, Soils Data & Curve Number: The SCS curve number loss rate methodology was utilized to approximate infiltration for the drainage basins. The watershed lies within Soil Types 192, 305, 540 and 630 per the Las Vegas Valley Soil Survey. The 2008 Las Vegas Valley MPU Curve Number Matrix, as taken from GIS data provided by the CCRFCD, was utilized to determine the composite curve number for offsite drainage basins. The 2008 Las Vegas Valley MPU Curve Number Matrix accounts for areas within the Drought Ordinance boundary. Table 4-2 from the CCRFCD 2008 MPU was utilized for determining curve numbers for offsite drainage basins. The curve number for undeveloped offsite interim condition drainage basins was selected based on a land use of "Undeveloped Land, Open Desert". Exhibits I and J included in Appendix B depict soils types encompassing the interim and ultimate condition offsite watersheds, respectively.

Referenced Tables 602 and 602A from the CCRFCD Manual were utilized for determining curve numbers for onsite drainage basins. Curve numbers for the developed onsite drainage basins are based on land uses and densities specified by the latest land use plan provided by the developer, Crescent Bay Holdings. The land use plan exhibit and density spreadsheet are included in Appendix B for reference. For residential land uses, the maximum density is used to calculate the average lot size; the calculated average lot size is used to select the appropriate curve number. For residential densities with a calculated

average lot size 6,000 square feet or less, multi-family residential, and public facilities a curve number associated with commercial land use has been utilized. Roadways utilize a curve number for paved roads. A natural desert landscaping curve number is utilized for parks and open spaces. Curve number data and computations, including CCRFCD Manual reference tables, are included in Appendix B.

Lag Time: The lag time is defined as the time measured from the center of mass of effective rainfall to the time to peak of the outflow hydrograph. The lag time is related to the time of concentration as 0.6 times the time of concentration. The time of concentration is defined as the time required for runoff to flow from the hydraulically most distant point of a basin to the outlet point of the basin. The lag time computations have been included in Appendix B.

Channel Routing: The Muskingum-Cunge Method was utilized in channel routing of hydrographs. The Muskingum-Cunge Method requires the following physical input parameters: reach length, longitudinal slope, roughness coefficient, base width, and side slope.

Detention Basin Routing: Detention basin routing was performed using the Modified Puls method within the USCOE HEC-1 computer program. The Elevation-Volume-Discharge relationship for the detention basin, as taken from the DB Study, was entered into the HEC-1 program routine in order to compute detention basin performance components such as peak storage, peak elevation and peak discharge.

2.3 Hydraulic Modeling

Detention Basin: Design of the proposed detention basin is in accordance with criteria set forth in Section 1200 of the CCRFCD Manual with noted exceptions indicated by the DB Study. The detention basin is designed in accordance with criteria set forth in Section 304.8 of the CCRFCD Manual for Multiple Use Facilities. Notably, the portion of the facility that will be identified for open field public use has been elevated above the peak 10-year storm event water surface elevation in the basin. Please note that generally at the conceptual design level, detention basin design is very conceptual in nature. However, since the technical design of the detention basin has already been addressed, the technical design characteristics determined with the DB Study have been utilized in this Master Drainage Study.

Per the DB Study, the proposed detention basin incorporates an orifice outlet controlled primary outlet structure designed per CCRFCD Manual Eqn. 1202. The outlet orifice was sized with the DB Study to limit peak 100-year discharge to that established by the Aliante Study at the ultimate discharge location into the downstream Aliante Golf Course Channel (at Concentration Point CP2). Orifice computations have not been recomputed with this Master Drainage Study. The stage-storage-discharge relationship established in the DB Study has been referenced with this Master Drainage Study.

Also per the DB Study, an overflow spillway discharging to Grand Teton Drive is proposed. Additionally, sediment loading (in accordance with CCRFCD Manual Section 1300) has been accounted for in the detention basin design. Lastly, water quality measures pursuant to recently adopted CCRFCD policy have been implemented in the design of the detention basin per the DB Study. Refer to the DB Study for further discussion and technical design of the proposed detention basin.

Street Flow Splits: Offsite street flow splits have been analyzed utilizing the Flowmaster Version 7.0 software by Haestad Methods. An equal flow depth method has been applied to quantify the flow conveyed in each street. For areas where only half streets are complete, the flow split has been determined based on the half street capacity. Flow in excess of the half street capacity has been assumed to split.

Street Flow Hydraulics: Street flows and capacities have been analyzed utilizing the Flowmaster Version 7.0 software by Haestad Methods. In accordance with the CCRFCD Manual, the velocity times depth factor (v x d) for street flow for the 10-year storm event must be less than or equal to 6, with a maximum depth of 1-ft. The velocity times depth factor (v x d) for street flow for the 100-year storm event must be less than or equal to 8, with a maximum depth of 2-ft. For 80-ft and greater right-of-ways, a 12-ft dry lane (not utilizing the center turning lane) must be provided in the 10-year storm event. Additionally, for intersections with an 80-ft right-of-way or greater, a maximum 100-year flow depth of 1-foot is allowed, and a maximum 10-year flow depth of 0.5-feet is allowed. Grand Teton Drive, Decatur Boulevard, Elkhorn Road, and Aliante Parkway are classified as 80-ft or greater width right-of-ways and are therefore subject to 10-year dry lane criteria.

Generally, at the Master Drainage Study conceptual design level, it is standard practice for Slater Hanifan Group to utilize general street sections and estimated slopes to determine street flow capacities. Furthermore, more stringent in-house street design criteria than that set forth in the CCRFCD is utilized in order to account for variation in street slopes and/or sections at the technical design level. However, since technical design of the streets within the Park Highlands West development has been completed per the approved Area Studies (by others), approved improvement plans have been referenced for street section and slopes in order to determine roadway capacities, and CCRFCD criteria was utilized to evaluate design.

Storm Drain: In general, storm drain has been designed to maximize street flows upstream while allowing for full 100-year flow capture prior to discharge from the site. Existing storm drain laterals and stubs, as well as proposed storm drain mainlines, have been analyzed utilizing Flowmaster Version 7.0 software by Haestad Methods. Due to the unique nature of this project (given that much of the onsite storm drain is existing and all of the onsite storm drain has been technically designed) the storm drain has been evaluated based on full flow diameter without upsizing and utilizing existing storm drain slopes.

Furthermore, four (4) of the mainline storm drain systems included as part of this Master Drainage Study have been analyzed utilizing the Water Surface and Pressure Gradient (WSPG & WSPGW) Hydraulic Analysis System software by the Los Angeles County Department of Public Works. Again, this is not generally the approach with a Master Drainage Study; however, since the systems have already been technically designed and constructed, and changes to the site plan have occurred that impact the flow rates to these facilities, the more detailed analysis was considered warranted. The systems analyzed with WSPG or WSPGW are as follows:

1) Farm Road – Decatur Boulevard to Aliante Golf Course Channel
2) Virage Park Drive East – Detention Basin Outflow to Farm Road
3) Virage Park Drive West – Aviary Way to Detention Basin Inflow

4) Grand Teton Drive – Decatur Boulevard to Detention Basin Inflow

As outlined in the CCRFCD Manual, storm drain facilities are designed to maintain a hydraulic gradient line (HGL) a minimum of 1-ft below above finished grade and limit the flow velocities in the facility to less than 25 ft/s. Drop inlet sizing is outside the scope of this Master Drainage Study and have not been assessed.

3 EXISTING/HISTORIC CONDITION

3.1 Discussion of Existing/Historic Condition

The existing/historic condition for the project site was analyzed with the Aliante Study and has been referenced with this Master Drainage Study. The Aliante Study establishes the allowable discharges at the proposed ultimate discharge locations. The allowable discharges, as determined with the Aliante Study, are summarized in Table 3 below. Refer to Appendix F relevant reference material from the Aliante Study.

Table 3: Allowable Discharge Summary
Established with the Aliante Study

Location	Aliante Study (Allowable)		This Study
	HEC-1 Node	Q_{100} (cfs)	HEC-1 Node
Linear Park at Aliante Parkway	4D	243	PT1
Aliante Golf Course Channel	IN6	512	PT2
Elkhorn Road	ULT7	107	PT3
Linear Park at Aviary Way	7A	550	PT4

4 INTERIM CONDITION

4.1 Definition of Interim Condition

The interim condition for the Park Highlands West project site assumes the following:

- Offsite watershed is in its current existing state, partially developed with residential subdivisions, schools and parks, and partially undeveloped desert terrain. Offsite surface flow drainage patterns are assumed to follow drainage patterns current to date.
- Onsite watershed is developed in accordance with the revised land use plan provided with this Master Drainage Study in Appendix B.
- Grand Teton Drive from Decatur Boulevard to Aliante Parkway is considered fully improved.
- All offsite flood control infrastructure as proposed by this project is considered constructed. The interim condition facilities in Grand Teton Drive west of Decatur (Facilities I1 and I2) are also considered in place. In addition, the future laterals and drop inlets along the north side of Grand Teton Drive are also considered constructed.

The only offsite infrastructure not constructed is the future CLV facilities west of Decatur Boulevard (Facilities F1 and F2).

- Onsite flood control infrastructure (detention basin, mainline storm drain, drop inlets and lateral storm drain) proposed by this project are installed.

Note that the interim condition is provided in order to determine the amount of interim condition flow that needs to be collected by interim Facilities I1 and I2. The interim condition does not control the final design of any of the permanent storm drain infrastructure.

4.2 Discussion of Interim Condition

Offsite: The offsite watershed primarily drains in a southeasterly direction. The northern limit of the watershed was defined based on existing CCRFCD Regional Facilities that route flows east away from the project site. The western limit of the watershed was defined by existing topography and residential development. The southern limit of the watershed was controlled by the existing Grand Teton Drive improvements. Within the offsite watershed, flow splits have been assessed at numerous intersection locations.

Note that the offsite drainage patterns provided in this report have been revised from those established by the CDS due to the following:

- The CDS referenced the NWN Study for offsite hydrology. Since, offsite development has been constructed that has altered the offsite drainage patterns and flow rates. The offsite drainage patterns provided in this report are based on technical designs of residential, roadway and storm drain improvements, as well as extensive field investigation of the offsite terrain.
- The CCRFCD Regional Facility in Decatur Boulevard from Whispering Sands to Dorrell Lane is considered in place per the referenced Decatur Facility Plans; therefore, Decatur Boulevard acts as a cutoff for flow from the west and no offsite flow from the west enters the project site.

The offsite drainage patterns presented herein are identical to those utilized in the DB Study. Note that per the DB Study, in the ultimate condition CLV is obligated to intercept one half of the total ultimate condition flow at the Decatur/Grand Teton intersection via future storm drain facilities. This project is obligated to provide sufficient interim condition infrastructure west of the intersection to meet intersection street flow criteria downstream. Therefore, interim facilities (Facilities I1 and I2) have been designed to collect sufficient flow to meet downstream street flow criteria in the interim condition.

Onsite: The onsite fully developed condition drainage patterns presented herein are similar to the previously approved CDS. However, the following revisions have been made based on the revised site and land use plan:

- Basins 2-9 and 4-4 are proposed as residential development instead of park based on the revised land use plan.
- The parcel boundary of Basins 2-11 and 2-12 has shifted north, the Basin 2-13 boundary has been modified, and Basin 3-2 has been added; however, drainage patterns in that area remain unchanged.
- The boundary for Basin 2-10 has been modified and Basin 4-7 has been added; however drainage patterns in that area remain unchanged.

- Basin 2-3 is proposed as a detention basin (per the approved DB Study) instead of residential development.

The onsite watershed drains primarily in a southeasterly direction without any flow splits. The onsite watershed is only impacted by the offsite watershed at one location, the intersection of Aviary Way and Grand Teton Drive. The offsite flows enter the onsite watershed via a storm drain facility into the proposed detention basin. As previously discussed, the offsite flow at the intersection of Decatur Boulevard and Whispering Sands Drive has been diverted south per the Decatur Facility Plans and no longer impacts the onsite watershed. In addition to the offsite watershed discharging into the proposed detention basin, four (4) onsite drainage basins also contribute flows to the proposed detention basin. The offsite flows (as discharged from the proposed detention basin) combine with a portion of onsite flows and discharge into the Aliante Golf Course Channel at Concentration Point PT2. There are three (3) additional discharge locations for onsite flow, including a linear park east of Aliante Parkway (PT1), Elkhorn Road (PT3), and a linear park east of Aviary Way (PT4).

The interim condition offsite flows entering the site are less than the ultimate condition. Therefore, all onsite storm drain has been designed utilizing the worst-case ultimate condition flows.

4.3 Summary of Interim Condition

Refer to Exhibit L, included in Appendix A, for an illustration of the interim condition offsite drainage basins and flow patterns, as well as summary tables of the flow rates and flow splits. Refer to Exhibit N also included in Appendix A, for a summary of onsite interim conditions flows at the concentration points. Note that the onsite basins have only been analyzed as fully developed; however, since offsite interim condition flows are impacting the site, the interim condition onsite concentration point flow rates differ from the ultimate condition onsite concentration points.

Allowable flows at each of the discharge locations have been established by the Aliante Study. Table 4 below provides a comparison of the allowable discharges as determined by the Aliante study to the interim condition flows determined with this Master Drainage Study.

Table 4: Interim Condition Discharge Comparison Summary
Aliante Study (Allowable) vs. This Study (Interim Condition)

Location	Aliante Study (Allowable)		This Study (Interim Condition)	
	HEC-1 Node	Q_{100} (cfs)	HEC-1 Node	Q_{100} (cfs)
Linear Park at Aliante Parkway	4D	243	PT1	232
Aliante Golf Course Channel	IN6	512	PT2	462
Elkhorn Road	ULT7	107	PT3	89
Linear Park at Aviary Way	7A	550	PT4	505

As illustrated in Table 4 above, the interim condition flow rates at each of the discharge locations are less than the allowable discharges at each location as determined with the

Aliante Study. Therefore, the interim condition analyzed for the Park Highlands West project site as results in no negative impacts to downstream properties. Please see relevant reference material from the Aliante Study included in Appendix F.

5 ULTIMATE CONDITION

5.1 Definition of Ultimate Condition

The ultimate condition is considered the same as the interim condition with the following exceptions:

- The offsite watershed is considered fully developed. Drainage patterns are in accordance with the CCRFCD MPU, except as modified by this study based on review of relevant studies and field investigation that warranted changes.
- Ultimate CLV facilities located west of Decatur Boulevard along Grand Teton Drive (Facilities F1 and F2) are constructed. These facilities will be capable of intercepting one-half of the entire ultimate condition 100-year peak surface flow at the intersection of Grand Teton Drive and Decatur Boulevard. The obligation of these future drop inlets is considered that of the CLV as determined in the DB Study.
- Regional Facility GTEA0360 (Decatur Boulevard facility from Horse Drive and Grand Teton Drive) is not anticipated to be constructed since the majority of the Decatur Boulevard roadway improvements are complete thru that stretch and adjacent developments have designed assuming the facility is not constructed.

In the ultimate condition, storm drain flow east of the Decatur Boulevard along Grand Teton Drive is greater than the interim condition. The ultimate condition was analyzed to ensure that the proposed storm drain will have adequate capacity and function for the worst case flow when the ultimate CLV inlets west of Decatur Boulevard along Grand Teton Drive are installed. The ultimate condition controls the mainline storm drain design in Grand Teton Drive, as well as the proposed detention basin and onsite storm drain infrastructure.

5.2 Discussion of Ultimate Condition

Offsite: Similar to the interim condition, the ultimate condition offsite watershed generally drains in a southeasterly direction. The northern limit of the watershed was defined based on existing and proposed Regional Flood Control Facilities as well as areas defined by the CCRFCD 2008 MPU that route flows east away from the project site. The western limit of the watershed was defined by existing residential development as well as areas defined by the CCRFCD 2008 MPU that route flows south away from the project site. The southern limit of the watershed was controlled by the existing Grand Teton Drive improvements. Within the offsite watershed, flow splits have been assessed at numerous intersection locations.

Onsite: The onsite watershed remains the same as the interim condition (as described in Section 4.2 above). However, in the ultimate condition, the larger offsite flows are collected in Grand Teton Drive and routed to the onsite detention basin. Therefore, the design of all onsite facilities is controlled by the higher ultimate condition flow rates.

5.3 Summary of Ultimate Condition

Refer to Exhibit M, included in Appendix A, for an illustration of the ultimate condition offsite drainage basins and flow patterns, as well as summary tables of the offsite flow rates and flow splits. Refer to Exhibit N, also included in Appendix A, for the ultimate condition onsite drainage basins and flow patterns, as well as summary tables of the flow rates.

As discussed, the ultimate condition flow rates result in the highest flows at each of the four (4) discharge locations. Allowable flows at each of the discharge locations have been established by the Aliante Study. Therefore, the Table 5 below provides a comparison of the allowable discharges as determined by the Aliante study to the ultimate condition flows determined with this Master Drainage Study.

Table 5: Ultimate Condition Discharge Comparison Summary

Aliante Study (Allowable) vs. This Study (Ultimate Condition)

Location	Aliante Study (Allowable)		This Study (Ultimate Condition)	
	HEC-1 Node	Q_{100} (cfs)	HEC-1 Node	Q_{100} (cfs)
Linear Park at Aliante Parkway	4D	243	PT1	232
Aliante Golf Course Channel	IN6	512	PT2	466
Elkhorn Road	ULT7	107	PT3	89
Linear Park at Aviary Way	7A	550	PT4	505

As illustrated in Table 5 above, the worst-case ultimate condition flow rates at each of the discharge locations is less than the allowable discharge at each location as determined with the Aliante Study. Therefore, development of the Park Highlands West project site as proposed results in no negative impacts to downstream properties. Please see relevant reference material from the Aliante Study included in Appendix F.

6 STREET FLOW HYDRAULICS

6.1 Summary of Street Flow Capacity Computations

Based on the street flow criteria set forth in Section 2.3 of this report, street flow capacities for the 100-year and 10-year storm events have been calculated for perimeter and onsite roadways. See Exhibit O included in Appendix A for reference to the street section locations. Also refer to Appendix D for street capacity Flowmaster calculations. Results are summarized in Tables 6 and 7. Note that where street flow capacities are exceeded, storm drain facilities have been extended to collect flow.

Table 6: 100-Year Street Flow Capacity Summary

Street Section	ROW Width (ft)	Slope (%)	Q (cfs)	Depth (ft)	Velocity (fps)	D x V	Control
1	90	1.04	336	1.15	6.96	8.0	D x V

23	*100	1.19	60	0.78	4.87	3.8	Dry Lane
24	*90	0.53	11	0.55	2.50	1.4	Dry Lane
25	90	0.42	33	0.65	2.53	1.6	Dry Lane
26	90	1.01	52	0.65	3.92	2.5	Dry Lane
27	*70	0.50	76	1.00	4.53	4.5	Depth
28	41	0.50	134	1.00	4.96	5.0	Depth
29	96	2.47	118	0.71	7.06	5.0	Dry Lane
30	96	0.50	53	0.71	3.17	2.3	Dry Lane

* Only Half Street Calculations were analyzed for these cross sections

Upon review of Tables 6 and 7 above, the street flow proposed with the Park Highlands West development satisfies CCRFCD criteria for 100-year and 10-year depth and DxV parameters, as well as 10-year dry lane criteria, as set forth in Section 2.3 of this report.

7 RECOMMENDED DRAINAGE FACILITIES

7.1 Summary of Recommended Drainage Facilities

Exhibit P included in Appendix A provides a depiction and summary of conceptual flood control facilities recommended for the Park Highlands West project site. As discussed, many of the onsite facilities exist per the approved Area Studies. Sizing and analysis of the facilities was performed per criteria described in Section 2.3 of this report. Note that with the exception of interim Facilities I1 and I2, all recommended facilities are designed based on the worst-case ultimate condition design flows. Flood control facility computations are included in Appendix E.

7.2 CCRFCD Facility in Grand Teton Drive

The CCRFCD Regional Facility in Grand Teton Drive has been technically addressed with the DB Study. This Master Drainage Study matches the design proposed with the DB Study and proposes no revisions to the currently approved storm drain design in Grand Teton Drive. The information is shown on this Master Drainage Study for completeness and to illustrate the comprehensive conceptual plan for the area.

Note that interim Facilities I1 and I2 are designed to collect sufficient interim condition flow in order for downstream street flow criteria to be met. Per coordination with CLV and CNLV, and per the approved DB Study, future Facilities F1 and F2 will be constructed (by others) to collect the CLV obligation of ultimate condition flow (half of the surface flow at the intersection of Grand Teton Drive and Decatur Boulevard) in order for downstream flow criteria to be met in the ultimate condition. The worst-case ultimate condition WSPGW analysis for the CCRFCD Regional Facility is provided in Appendix E of this Master Plan Study and matches the analysis approved by the DB Study. The laterals and stubs have been analyzed based on full flow capacity. Note that per the Flowmaster full flow computations, Facilities P8 and P18 are undersized; however, per the approved DB Study technical analysis, the referenced improvement plans located in Appendix F illustrate that those facilities are indeed adequate to convey the required flow with the HGL a minimum of 1-foot below finished grade. Therefore, the facilities are considered adequate and are shown on Exhibit P as proposed in the DB Study. Refer to the DB Study for more detailed technical discussion concerning the facilities in Grand Teton Drive.

7.3 CCRFCD Onsite Detention Basin

The proposed onsite detention basin (Facility P39) is proposed at the southeast corner of the intersection of Grand Teton Drive and Aviary Way. The detention basin has been proposed as a CCRFCD Regional Facility to replace the extension of the Regional Facility in Grand Teton Drive. The detention basin is designed to capture the entire worst-case ultimate condition 100-year flow at the intersection of Grand Teton Drive and Aviary Way. Flow will enter the detention basin via the proposed storm drain system in Grand Teton Drive. The intention of the detention basin is to eliminate the need for the future extension to the east of the regional facility in Grand Teton Drive, as well as to attenuate flow such that the downstream allowable discharge is met at Concentration Point CP2 within the Aliante Golf Course Channel.

Contrary to most Master Drainage Studies, this detention basin has already been technically designed per the DB Study. Therefore, the technical design parameters for the detention basin have been referenced from the DB Study for use in analysis with this Master Drainage Study. See relevant reference material from the DB Study included in Appendix F. Table 8 provides a summary of the detention basin characteristics, which match exactly the detention basin characteristics determined with the DB Study. Refer to the DB Study for more detailed technical discussion concerning the proposed detention basin.

Table 8: Detention Basin Characteristics	
100-Year Storm Event	
Basin Attribute	**Design Parameter**
Contributing Area	3.19 mi^2
Peak Inflow	1,066 cfs (SDN3)
Orifice Dimension/Invert	54" / 2297.00
Outfall Conduit	72" RCP @ 0.003 ft/ft / 2295.50
Peak Water Surface Elevation	2307.02 ft
Peak Outflow	231 cfs
Peak Storage Volume	103 ac-ft
Sediment Storage Provided/Required	23 ac-ft / 1.56 ac-ft
Drain Time	13 Hr, 40 Min
10-Year Storm Event	
Basin Attribute	**Design Parameter**
Peak Inflow	370 cfs
Peak Outflow	141 cfs
Peak Water Surface Elevation	2302.14 ft
Peak Storage Volume	31 ac-ft
Overflow Spillway	
Basin Attribute	**Design Parameter**
Crest Length/Elevation	200 LF / 2308.5
Design Discharge Capacity/Elevation	1,700 cfs / 2310.5
Peak Storage Volume/Elevation	159 ac-ft / 2310.5

7.4 Onsite Storm Drain

As previously discussed, much of the onsite storm drain is constructed and in place per the approved Area Studies, and is shown as existing on Exhibit P. With the exception of onsite proposed Facilities P47 and P74, which are being proposed with this Master Drainage Study for the first time, all other proposed facilities have already been technically designed with approved technical drainage studies. Proposed Facilities P48 thru P65 have been addressed with the approved Area 8 & 9 Study. Proposed Facilities P35 thru P46 have been addressed with the DB Study. Therefore, no revisions in size are proposed to existing and or proposed facilities as design of the facilities has already been technically addressed. However, all facilities have been evaluated either per full flow capacity computations or with WSPG/WSPGW analyses in order to verify that the storm drain designs are still valid with the hydrologic revisions proposed herein.

The onsite facilities that have been evaluated utilizing WSPG/WSPGW are:

- Farm Road – Decatur Boulevard to Aliante Golf Course Channel (extending from upstream Facility E52 to downstream Facility E51)
- Virage Park Drive East – Detention Basin Outflow to Farm Road (extending from upstream Facility P40 to downstream Facility P46)
- Virage Park Drive West – Aviary Way to Detention Basin Inflow (extending from upstream Facility E17 to downstream Facility P38)

Note that all facilities re-evaluated using WSPG/WSPGW meet criteria as set forth in Section 2.3 of this report. WSPG/WSPGW analyses have been included in Appendix E.

For the remaining onsite facilities, existing and proposed, full flow capacity computation have been performed to ensure that the facilities are adequately sized. All onsite facilities have been found to be adequately sized per the full flow capacity computations with the following exceptions:

- Facility E81 – This facility appears undersized per the full flow capacity compuations. However, per the referenced Area 2 Plans, the HGL in the proposed facility per the technical design is minimum of 1-foot below finished grade; therefore, the facility is adequately sized and no revisions have been made.
- Facility E83 – This facility appears undersized per the full flow capacity compuations. However, per the referenced Area 3 Plans, the HGL in the proposed facility per the technical design is minimum of 1-foot below finished grade; therefore, the facility is adequately sized and no revisions have been made.
- Facilities P61 thru P63 - These facility appear undersized per the full flow capacity compuations. However, per the referenced Area 8 & 9 Study plans, the HGL in the proposed facility per the technical design is minimum of 1-foot below finished grade; therefore, the facility is adequately sized and no revisions have been made.
- Facilities P35 and P36 – These facility appear undersized per the full flow capacity compuations. However, per the referenced DB Study plans, the HGL in the proposed facility per the technical design is minimum of 1-foot below finished grade; therefore, the facility is adequately sized and no revisions have been made.

Note that no increase in design flow to the above mentioned facilities is proposed with this Master Drainage Study. See the referenced improvement plans included in Appendix F for referenced to the approved technical designs.

8 CONCLUSIONS & RECOMMENDATIONS

1. The methodologies utilized in the preparation of this study are in compliance with the Clark County Regional Flood Control District's Hydrologic and Drainage Design Manual and local entity criteria.

2. The proposed project site is not located in a FEMA designated Special Flood Hazard Area (SFHA) per review of Flood Insurance Rate Map (FIRM) Panel 32003C1765F, dated November 16, 2011.

3. The project is adjacent to proposed CCRFCD Regional Facilities in Decatur Boulevard and proposes revisions to the currently proposed CCRFCD Regional Facilities in Grand Teton Drive. Therefore, CCRFCD concurrence will be required and an amendment to the 2008 CCRFCD MPU will be required.

4. Allowable discharges as determined with the Aliante Study have not been exceeded as a result of development of the Park Highlands West project site. Therefore, runoff generated from or conveyed by the project will not adversely impact any downstream properties or facilities.

5. This Master Drainage Study is in conformance with several approved Technical Drainage Studies that have been performed for the Park Highlands West site.

6. Interim condition Facilities I1 and I2 proposed with this study will be replaced in the future with CLV future Facilities F1 and F2 (by others), per the approved DB Study.

Re: Update #2 to the Master Drainage Study for Park Highlands West (AKA North Las Vegas 600-Acre Site)
CNLV No. 46257

Dear Mr. Failla and Mrs. Collins:

On April 23, 2014, CNLV conditionally approved the above referenced study, dated May 29, 2013, Addendum #1, dated October 28, and Addendum #2, dated February 11, 2014.

SHG submitted an Update #1, dated July 8, 2014 and Supplement #1, dated September 9, 2014 for CNLV to review and it was conditionally approved on September 25, 2014.

Finally, on March 16, 2015, SHG submitted a Master Drainage Study Update #2 and CNLV staff has reviewed and found it to meet the minimum accepted standards for the technical drainage study update. This acceptance is contingent upon the following conditions

1. Concurrence must be obtained by the Clark County Regional Flood Control District (CCRFCD) due to the proposed improvement's proximity to a Regional Flood Control Facilities. Please submit a copy of this drainage study and all addenda to CCRFCD upon acceptance from CNLV.

2. Since this study is proposing to add, remove, and revise various regional flood control facilities, a CCRFCD Master Plan Amendment must be completely processed by the Engineer once this study, the Technical Drainage Study for Park Highlands Grand Teton Regional Flood Control Facility (DB Study), and the Master Drainage Study for Park Highlands East have been reviewed and approved by CNLV, CLV, and CCRFCD.

All proposed CCRFCD's flood control facilities, by this project, must be fully maintained by the developer until the MPA has been approved and the maintenance funding has been secured by CNLV.

3. Approval from the City of Las Vegas (CLV) will be required since the project is adjacent to the jurisdictional boundary and will construct storm drain improvements within CLV's public ROW.

4. Please note that no onsite development will be allowed until either all required interim or the permanent flood control and infrastructure facilities are constructed to protect the proposed onsite improvements.

5. Please note that prior to approving the Improvement Drawings for the Park Highlands Grand Teton Regional Flood Control Facility (DB Study), all previously approved Improvement Drawings on CNLV files in this master plan must be revised to reflect the changes from the approved DB Study.

6. Please note that any changes to the proposed land-use or drainage patterns as shown in this study will require the Engineer to provide a drainage study update to this master drainage study.

7. Please coordinate with Duane McNelly, Development and Flood Control Project Leader, when submitting Improvement Drawings for this project. Mr. McNelly can be reached at (702) 633-2312.

Please be advised that all land surface area disturbances over 1 acre and/or adjacent to a water way must submit a "Notice of Intent" to discharge to the Nevada Division of Environmental Protection, which certifies that a stormwater pollution prevention plan has been developed and is maintained on site. For more information, including forms and applications, see http://ndep.nv.gov/bwpc/storm01.htm.

Acceptance of this drainage study update does not imply approval of the Improvement Drawings and calculations associated with the drainage for this site. A detailed review of the drawings will be performed by staff during the improvement plan review process.

Any future changes in the proposed design (or design assumptions) as outlined in the approved drainage study and the attached preliminary plans which affect drainage must be addressed in a Drainage Study Amendment and accepted by the CNLV Development and Flood Control Section. Additionally, conditional acceptance of a drainage study is valid for a period of one (1) year. If the proposed construction has not been completed in that time period, CNLV reserves the right to require additional conditions and/or submission and acceptance of a complete drainage study update prior to further construction of a project.

CNLV, its officials, or employees assume no liability for information, data, calculations and conclusions presented by the consulting engineers. We, therefore, make no warranties, either expressed or implied, in conducting this review. If you have any questions concerning this matter, please contact me at (702)633-1932.

Sincerely,

Dan Le, P.E., CFM
Senior Engineer
Development and Flood Control Division

CITY OF LAS VEGAS INTER-OFFICE MEMORANDUM				DATE: April 27, 2015
TO: Land Development Services Department of Public Works				FROM: Albert Sung, P.E. Flood Control Project Engineer Department of Public Works
SUBJECT:	Drainage Study for: Park Highlands West (Project in CNLV) – Update #2 – AKA North Las Vegas 600-Acre Site			COPIES TO: Slater Hanifan Group (SHG)

1st Submittal	4/24/2014; 5/8/2014 & 5/19/2014	6/2/2014	Approved	$400.00	355211: $400
2nd Submittal	10/7/2014	11/5/2014	Conditionally Approved	$400.00	372551: $400
3rd Submittal	4/13/2015	4/27/2015	See Comments Below	$100.00	392666: $100
			TOTAL FEES (LDDRS):	**$900.00**	**----**

REMARKS: Master Plan Amendment Required.

3rd Submittal: Update #2 to revise a regional facility in *Horse Drive* to turn south at *Aviary Way*

2nd Submittal: Update #1 & Supplement #1 to propose a regional facility in *Horse Dr.* east of *Decatur Bl.*

1st Submittal: Development split into two projects.

The Drainage Study for the subject project has been reviewed and:

	is approved subject to conformance to all City standards and the following conditions:
	must be resubmitted or supplemented including the following:
	is conditionally approved subject to Clark County Regional Flood Control District concurrence.
X	is conditionally approved subject to Clark County Regional Flood Control District **Master Plan Amendment Approval**.

City of Las Vegas Flood Control* staff has reviewed the Technical Drainage Study, Addendum #1 and Addendum #2; Update #1, Supplement #1 and Update #2 of the subject development in the *City of North Las Vegas. City of Las Vegas* concurs with the acceptance of the drainage study by the *City of North Las Vegas Department of Public Works.* The review of this project was limited to issues of flood control significance to the *City of Las Vegas.

1. Study flow rates at the Grand Teton facility are based upon a *Clark County Regional Flood Control District Master Plan Amendment (MPA)* being adopted. Future MPU facilities will significantly impact these proposed facility improvements without the approval of the MPA. **If the MPA is not approved, the drainage studies and improvement plans must be updated to accommodate the flow impacts from the adopted Master Planned Facilities.**

2. Approval is predicated upon the construction of the *Grand Teton Regional Flood Control Facility* improvements at the west side of the intersection of *Decatur Boulevard* and as shown on the improvement plans prepared by SHG dated 11-12-2013.

NOTE: Any future changes to the proposed design (or design assumptions) as outlined in the approved drainage study and attached preliminary grading plan which affect drainage must be addressed in a Drainage Study Amendment and accepted by the *City of Las Vegas Flood Control Section*. Additionally, conditional acceptance of a drainage study is valid for a period of one (1) year. If the proposed construction has not been completed in that time period, the *City of Las Vegas* reserves the right to require additional conditions and/or submission and acceptance of a complete drainage study update prior to further construction of a project.

NOTE: Please be advised that all land surface area disturbances over 1 acre or any area adjacent to a water way must submit to the *Nevada Division of Environmental Protection* a "Notice of Intent" to discharge that certifies a stormwater pollution prevention plan has been developed and is maintained on site; for inclusion in the Stormwater General Permit No. NVR100000. A phased construction unit in a contiguous subdivision is considered under construction until all stripped or disturbed surface areas have been covered by paving, building construction or planting. For more information, including forms and applications see http://ndep.nv.gov/bwpc/storm01.htm or call (775) 687-9429.

DISTRICT CONCURRENCE: UPDATE #2 FOR PARK HIGHLANDS WEST (AKA NORTH LAS VEGAS 600-ACRE SITE) (CNLV #46257) (RFCD No. 15-9489)

Dear Mr. Le:

Clark County Regional Flood Control District (District) reviewed Technical Drainage Study dated March 12, 2015 for above-mentioned project as submitted by SLATER HANIFAN GROUP. In addition, District is in receipt of the Conditional Letter of Acceptance from City of North Las Vegas Public Works dated April 6, 2015.

District concurs with acceptance of this Technical Drainage Study by City of North Las Vegas Public Works.

District's review of this project was limited to issues of Regional Flood Control Significance as defined in *Uniform Regulations for the Control of Drainage*.

Please be aware that as additional information becomes available and/or restudies of Flood Insurance Studies are performed, information submitted by SLATER HANIFAN GROUP may be superseded. Compliance with regulatory elements and design standards specified in *Uniform Regulations for the Control of Drainage* does not imply a guarantee that properties will be free from flooding or flood damage. The District, its officials, or employees assume no liability for information, data, or conclusions presented by consulting engineers. We, therefore, make no warranties, either expressed or implied, in conducting this review.

Subject: Update No. 2 to the Master Drainage Study for Park Highlands West (CNLV No. 46257, CLV No. 4670 and RFCD No. 14-9310)

Dear Mr. Le:

This letter is intended to serve as the second update to the *Master Drainage Study for Park Highlands West,* which was approved by the City of North Las Vegas (CNLV) on April 23, 2014 and concurred by Clark County Regional Flood Control District (RFCD) and the City of Las Vegas (CLV) on May 19, 2014 and June 3, 2014, respectively. The first update titled *Master Drainage Study Update No.1 for Park Highlands West* (hereafter referred to as Update No. 1), was approved by the CNLV on September 25, 2014 and concurred by RFCD and CLV on October 15, 2014 and November 5, 2014, respectively. The approval and concurrence letters are provided in Appendix A.

This Update No. 2 addresses a change in the ultimate condition upstream drainage patterns and impacts to the Grand Teton regional storm drain facility and Park Highlands West Detention Basin (PHW DB) based on CNLV/CCRFCD coordination for the Park Highlands West CCRFCD Master Plan Amendment (PHW MPA) that was submitted to CNLV on December 23, 2014. More specifically, based on coordination meetings with CNLV and CCRFCD, it was decided to adjust the previously proposed plan. The previously proposed plan was to direct storm flows from the Decatur Blvd and Horse Drive intersection east along Horse Drive with discharge onto the Conservation Transfer Area (CTA) at Aliante Parkway. The adjusted plan is to direct storm flows from the Decatur Blvd and Horse Drive intersection along Horse Drive and then south along Aviary Way with discharge into the Grand Teton Regional Storm Drain Facility which feeds into the Park Highlands West Detention Basin. Coordination meetings with CNLV and CCRFCD related to this change were held on August 25, 2014 and September 22, 2014. It is noted that this change is related to future planning of flow patterns and facilities. Upstream regional facilities required to accommodate this flow pattern will be designed and constructed as part of a future CIP project; however this Update No. 2 provides supporting hydrologic and hydraulic computations and design changes to accommodate the additional flow to the facilities proposed as part of the Park Highlands Grand Teton Regional Flood Control Facility project. Note that the necessary design changes to the Grand Teton storm drain facility and PHW DB, have been technically addressed with Update No. 2 to the Technical Drainage Study for Park Highlands Grand Teton Regional Flood Control Facility (hereafter referred to as TDS Update2). This Update No. 2 and the TDS Update2 are based solely on impacts resulting from the coordination effort for the PHW MPA.

This Update No. 2, provides a revised hydrologic analyses that mimics the hydrologic analyses provided with the TDS Update2 and updates the storm drain inventory to reflect the changes that have been proposed with the TDS Update2 as coordinated with the PHW MPA. Similar to the TDS Update2, this Update No. 2 will show that there are no adverse impacts as a result of the proposed changes.

Hydrologic Analyses:

Drainage Pattern – Provided in Appendix D is a copy of the facilities map associated with the PHW MPA. As coordinated with CNLV and CCRFCD, the facilities map from the PHW MPA indicates how the ultimate condition drainage pattern for this Update No. 2 has been modified. The proposed changes to the regional facility alignments impact the drainage pattern of the ultimate condition and not the interim condition. Therefore, the interim condition drainage pattern provided in the previous Update No. 1 remains valid and this Update No. 2 provides a revised ultimate condition hydrologic analysis to reflect the revised ultimate condition drainage pattern. Please note that although the interim condition drainage pattern has not changed the hydrologic models have been revised and included with this Update No. 2 to reflect revised orifice size of the PHW DB.

The drainage patterns previously presented for the ultimate condition remain the same to the Decatur Blvd and Horse Drive intersection. With the planned regional facilities associated with the PHW MPA, the flows from the Decatur Blvd and Horse Drive intersection is to be routed east via a future regional facility along Horse Drive. The future regional facility will then be routed south along Aviary Way to the proposed Grand Teton Drive regional facility and Park Highlands West Detention Basin associated with this Update No. 2.

Please refer to the revised Exhibit M, in Appendix B, for an illustration of the updated drainage pattern to the ultimate condition offsite watershed. Note that the onsite drainage pattern has not been altered but the onsite drainage map, Exhibit N, has been updated to report the updated flow rates entering and discharging from the PHW DB. The updated Exhibit N has been provided in Appendix B.

Resulting Flow Rates – The revision to the drainage patterns upstream of the proposed PHW DB during the ultimate condition has increased flows to a portion of the Grand Teton Drive storm drain system that discharges into the PHW DB. Since the flows have increased to the Grand Teton Drive storm drain system, the peak flow rate and storage volume have also increased in the detention basin during the ultimate condition. The peak storage volume is further increased due to the outlet modification with this Update No. 2 to maintain a similar detention basin discharge as previously approved.

Please note that although the peak inflow and volume have increased with this Update No. 2, the PHW DB designed stage-storage has not changed. However, with the increase in peak inflow and volume to the PHW DB, the stage-discharge required modification to limit the discharge. Please see the Hydraulic Analyses and Conclusion discussions in this letter for further detail of the revisions to the PHW DB. Since the stage-discharge to the PHW DB changed to accommodate the ultimate condition flow rates, the hydrologic models for the interim conditions have been reassessed with the modified PHW DB stage-discharge. As

previously stated, the drainage pattern for the interim condition has not been modified but the resulting flow rates downstream of the PHW DB have changed.

This Update No. 2 performs the previous Update No. 1 CNLV request which is assessing the ultimate condition watershed downstream of the PHW DB with a Method A and Method B hydrologic approach. The definition of the two approaches are as follows:

- **Method A:** This method is defined as a storm centering over the entire watershed, upstream and downstream of the proposed PHW DB. From the ultimate condition 100-year HEC-1 model, the flow rate of the concentration points located downstream of the PHW DB are selected based on DARF that is inclusive of the drainage area to the PHW DB and the drainage area downstream of the PHW DB that drains to the specific concentration point.

- **Method B:** This methodology is defined as a localized peak storm centering in which there is an algebraic summation of the peak runoff of drainage basins located downstream of the PHW DB plus the discharge out of the PHW DB at the peak time of the drainage basins located downstream of the PHW DB. The peak of the individual drainage basins downstream of the PHW DB occurs at approximately 3hr 35min.

It should also be noted that the change in drainage patterns for the ultimate condition does not alter any of the surface flow rates in or around the Park Highlands West community. There is only impact to the storm drain.

Please refer to Exhibits M and N, in Appendix B, for the updated flow rate summary tables. The supporting interim condition and ultimate condition HEC-1 models are provided in Appendix C.

Hydraulic Analyses:

There are various storm drain systems (existing and proposed) that are affected by the revised ultimate condition hydrologic analysis and they are as follows:

- Grand Teton Storm Drain (Decatur Blvd to Detention Basin Inflow)
- Virage Park Drive West Storm Drain (Decatur Blvd to Detention Basin Inflow
- Park Highlands West Detention Basin
- Virage Park Drive East Storm Drain (Detention Basin Outlet to Farm Road)
- Existing Storm Drain (Farm Road to Aliante Flood Channel)

Note that the revised hydraulic analyses and design changes are referenced from the TDS Update2 and provided in Appendix E.

Although the interim condition hydrologic analyses are updated with this Update No. 2, the interim condition flow rates do not control the design of the proposed storm drain systems. Therefore, no interim condition hydraulic analyses have been provided with this Update No. 2.

Conclusions:

Based on the revised ultimate condition hydrologic analysis and updated hydraulic assessments of the previously proposed storm drain infrastructure, some storm drain system designs are modified with the TDS Update2 to meet CCRFCD Manual Criteria and this Update No. 2 takes inventory of the revised facility sizes. The following discussions outline in detail the resulting changes to the impacted storm drain system associated with the Park Highlands West development. Please refer to the updated Exhibit P, in Appendix B, for a summary of the proposed facilities and their associated flow rates.

- Grand Teton Storm Drain (Decatur Blvd to Detention Basin Inflow)
  - Facility P30 is upsized to a 24-inch RCP from an 18-inch RCP
  - Facility P34 is upsized to a 14'x7' RCA from a 12'x7' RCA
- Virage Park Drive West Storm Drain (Decatur Blvd to Detention Basin Inflow)
  - Stub HGL for Facility E17 is updated to reflect the revised hydraulic analysis
- Park Highlands West Detention Basin
  - Facility P39e is downsized to a 53-inch orifice opening from a 54-inch opening
- Virage Park Drive East Storm Drain (Detention Basin Outlet to Farm Road)
  - Stub HGL for Facilities E31 and E33 is updated to reflect the revised hydraulic analysis
- Existing Storm Drain (Farm Road to Aliante Flood Channel)
  - Stub HGL for Facilities E44, E54, E55, E57 and E59 is updated to reflect the revised hydraulic analysis

With this Update No. 2, the discharge from the Park Highlands West community into the Aliante Flood Channel has changed. The discharge table from Update No. 1 has been updated with this Update No. 2 and presented below. This table provides a history of the previously approved discharge flow from the Park Highlands West community into the Aliante Flood Channel.

5740 S. Arville Street #216, Las Vegas, NV 89118 ph (702) 284-5300 fax (702) 284-5399

Discharge Table – Previously Reported vs. This Update No. 2						
Previously Reported					This Update No. 2	
Project	Study Description	Date of Study & Engineer	Concen-tration Point	100-Year Flow Rate (cfs)	Concen-tration Point	100-Year Flow Rate (cfs)
North Las Vegas 1905 Acres (Aliante)	**Update to Conceptual Study**	**Sept-2003 GC Wallace**	**IN6**	**512**	PT2 (Method B)	505
North Las Vegas 600 Acre Site (Park Highlands West)	Response to Comments No. 2 for Update No. 2	Feb-2007 GC Wallace	PT2	531		
Park Highlands West Area 3	Response to Comments No. 2 for Technical Drainage Study	Sept-2007 GC Wallace	PT2	542		
Park Highlands West Area 3	Addendum No. 3 for Update No. 1	Oct-2010 Slater Hanifan Group	PT2	448		
Park Highlands Grand Teton Regional Flood Control Facility	Addendum No. 2 for Technical Drainage Study	Nov-2013 Slater Hanifan Group	PT2	464		
Park Highlands Grand Teton Regional Flood Control Facility	Supplement to Update No. 1	May-2014 Slater Hanifan Group	PT2	503		

In reviewing the *Discharge Table – Previously Reported vs. This Update No. 2*, the discharge (505 cfs) presented in this Update No. 2 has increased by 3 cfs when compared to Update No. 1 (503 cfs). However, the North Las Vegas 1905 Acres (Aliante) project with Update to the Conceptual Study established the allowable discharge in to the Aliante Flood Channel from the Park Highlands West community. This Update No. 2 demonstrates that the discharge (505 cfs) is less than the allowable (512 cfs); therefore, poses no adverse impacts to downstream properties or drainage infrastructure.

The electronic files for this Update No. 2 are provided in Appendix F. If you have any questions or require additional information, please do not hesitate to contact us at 702-284-5300.

Respectfully Submitted,
SLATER HANIFAN GROUP

Re: Addendum to the Technical Drainage Study for Swing Parcel Channel
CNLV No. 10927; GCW No. 590.211.204

Dear Mr. McBride:

Staff has reviewed the above referenced study, dated June 5, 2003, and found it to meet the minimum accepted standards for a technical drainage study.

Acceptance of this drainage study does not imply approval of the grading plan or the structural calculations associated with the drainage for this site. A detailed review of the grading plan is performed by staff during the improvement plan review process.

The City assumes no responsibility for the information, data, and conclusions presented in this report. If you have any questions concerning this matter, please contact me at 633-2088.

Sincerely,

Jennifer E. Doody, PE
Senior Engineer
Development and Flood Control Division

PROJECT DATA
Project Title: SWING PARCEL CHANNEL
Project File : SPC.prj
Run Date and Time: 6/4/2003 2:36:39 PM

Project in English units

Project Description:
HECRAS model of Channel

PLAN DATA

Plan Title: HECRAS model of Channel
Plan File : f:\590-211-204\drainage\RTC\hec-ras\SPC.P01

Geometry Title: Base Conditions Geometry
Geometry File : f:\590-211-204\drainage\RTC\hec-ras\SPC.G01

Flow Title : 1 Flow Profiles
Flow File : f:\590-211-204\drainage\RTC\hec-ras\SPC.F01

Plan Summary Information:

Number of:	Cross Sections	= 35	Mulitple Openings	=	0
	Culverts	= 0	Inline Structures	=	0
	Bridges	= 0	Lateral Structures	=	0

Computational Information
Water surface calculation tolerance = 0.01
Critical depth calculaton tolerance = 0.01
Maximum number of interations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options
Critical depth computed at all cross sections
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Mixed Flow

FLOW DATA

ERRORS WARNINGS AND NOTES
Errors Warnings and Notes for Plan : HECRAS model

River: Reach #1 Reach: HECRAS model of RS: 1970 Profile: Q100
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS model of RS: 1465 Profile: Q100
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS model of RS: 1430.33* Profile: Q100
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS model of RS: 678 Profile: Q100
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS model of RS: 677 Profile: Q100
Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.
River: Reach #1 Reach: HECRAS model of RS: 600 Profile: Q100
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Note: Program found supercritical flow starting at this cross section.
River: Reach #1 Reach: HECRAS model of RS: 550 Profile: Q100
Note: Hydraulic jump has occurred between this cross section and the previous upstream section.
River: Reach #1 Reach: HECRAS model of RS: 530 Profile: Q100
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS model of RS: 487 Profile: Q100
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS model of RS: 100 Profile: Q100
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

Errors Warnings and Notes for Plan : HECRAS model

Location:	River: Reach #1 Reach: HECRAS model of RS: 1970 Profile: Q100
Warning:	The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7
	or greater than 1.4. This may indicate the need for additional cross sections.
Location:	River: Reach #1 Reach: HECRAS model of RS: 1465 Profile: Q100
Warning:	The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7
	or greater than 1.4. This may indicate the need for additional cross sections.
Location:	River: Reach #1 Reach: HECRAS model of RS: 1430.33* Profile: Q100
Warning:	The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7
	or greater than 1.4. This may indicate the need for additional cross sections.
Location:	River: Reach #1 Reach: HECRAS model of RS: 678 Profile: Q100
Warning:	The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7
	or greater than 1.4. This may indicate the need for additional cross sections.
Location:	River: Reach #1 Reach: HECRAS model of RS: 677 Profile: Q100
Warning:	The energy equation could not be balanced within the specified number of iterations. The program
	used critical depth for the water surface and continued on with the calculations.
Warning:	The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section.
	This may indicate the need for additional cross sections.
Warning:	During the standard step iterations, when the assumed water surface was set equal to critical depth,
	the calculated water surface came back below critical depth. This indicates that there is not a valid
	subcritical answer. The program defaulted to critical depth.
Location:	River: Reach #1 Reach: HECRAS model of RS: 600 Profile: Q100
Warning:	The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section.
	This may indicate the need for additional cross sections.
Note:	Program found supercritical flow starting at this cross section.
Location:	River: Reach #1 Reach: HECRAS model of RS: 550 Profile: Q100
Note:	Hydraulic jump has occurred between this cross section and the previous upstream section.
Location:	River: Reach #1 Reach: HECRAS model of RS: 530 Profile: Q100
Warning:	The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7
	or greater than 1.4. This may indicate the need for additional cross sections.
Location:	River: Reach #1 Reach: HECRAS model of RS: 487 Profile: Q100
Warning:	The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7
	or greater than 1.4. This may indicate the need for additional cross sections.
Location:	River: Reach #1 Reach: HECRAS model of RS: 100 Profile: Q100
Warning:	The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7
	or greater than 1.4. This may indicate the need for additional cross sections.

Re: Addendum No. 2 to the Technical Drainage Study for Club Aliante
CNLV No. 14029; GCW No. 590.211.612N

Dear Mr. Read:

Staff has reviewed the above referenced study, dated February 12, 2004, and found it to meet the minimum accepted standards for a technical drainage study.

Acceptance of this drainage study does not imply approval of the grading plan or the structural calculations associated with the drainage for this site. A detailed review of the grading plan is performed by staff during the improvement plan review process.

The City assumes no responsibility for the information, data, and conclusions presented in this report. If you have any questions concerning this matter, please contact me at 633-2088.

Sincerely,

Jennifer E. Doody, PE
Senior Engineer
Development and Flood Control Division

14029

BOX CULVERT

Inlet control and outlet control.

10 x 5 RCB

INPUT VARIABLES:

Box Height	5.00 ft
Box Width	10.00 ft
Slope	0.50 %
Manning's 'n'	0.013
Number of boxes	2
Culvert length	65 ft
Discharge	514 cfs
Ent. Coef. (Ke)	0.35

OUTPUT VARIABLES:

INLET CONTROL HWo:

Tapered throat	4.09 ft
45 degree bevels	4.28 ft
Sq. edge headwall	4.63 ft

OUTLET CONTROL HWo:

HWo depth	4.17 ft
Velocity	5.14 fps
Critical depth	2.74 ft

Note: 1. Outlet control assumes full flow.
2. Critical depth can not exceed the box height

Re: Addendum No. 2 to the Technical Drainage Study for Aliante Golf Course
CNLV No. 8338; GCW No. 590.211.202

Dear Mr. Read:

Staff has reviewed the above referenced study, dated November 14, 2002, 2001, and found it to meet the minimum accepted standards for a technical drainage study.

Acceptance of this drainage study does not imply approval of the grading plan or the structural calculations associated with the drainage for this site. A detailed review of the grading plan is performed by staff during the improvement plan review process.

The City assumes no responsibility for the information, data, and conclusions presented in this report. If you have any questions concerning this matter, please contact me at 633-2088.

Sincerely,

Jennifer E. Doody, PE
Senior Engineer
Development and Flood Control Division

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The energy loss was greater than 1.0 ft (0.3 m), between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program selected the water surface that had the least amount of error between computed and assumed values.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program selected the water surface that had the least amount of error between computed and assumed values.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program selected the water surface that had the least amount of error between computed and assumed values.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m), between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations.  The
         program used critical depth for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m).  This may indicate the need for
         additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less
         than 0.7 or greater than 1.4.  This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to
         critical depth, the calculated water surface came back below critical depth.  This indicates
         that there is not a valid subcritical answer.  The program defaulted to critical depth.

ERRORS WARNINGS AND NOTES
Errors Warnings and Notes for Plan : 590-211-202

River: Reach #1 Reach: HECRAS MODEL: WE RS: 6400 Profile: PF 1
Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 6350 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 6250 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 6150 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 6050 Profile: PF 1
Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 6000 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Note: Program found supercritical flow starting at this cross section.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 5925 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Note: Hydraulic jump has occurred between this cross section and the previous upstream section.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 5900 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 5800 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 5675 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 5625 Profile: PF 1
Warning: The energy equation could not be balanced within the specified number of iterations. The program selected the water surface that had the least amount of error between computed and assumed values.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 5575 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 5450 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 5400 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 5100 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 4950 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 4800 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 4750 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 4700 Profile: PF 1
Warning: The energy equation could not be balanced within the specified number of iterations. The program selected the water surface that had the least amount of error between computed and assumed values.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

River: Reach #1 Reach: HECRAS MODEL: WE RS: 4650 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 4645 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 4635 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 4442.5 Profile: PF 1 Upstream
Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 4442.5 Profile: PF 1 Downstream
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Note: The energy method has computed a class B profile.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 4250 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 4150 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 4100 Profile: PF 1
Warning: The energy equation could not be balanced within the specified number of iterations. The program selected the water surface that had the least amount of error between computed and assumed values.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 4000 Profile: PF 1
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Note: Hydraulic jump has occurred between this cross section and the previous upstream section.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 3900 Profile: PF 1
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
River: Reach #1 Reach: HECRAS MODEL: WE RS: 3750 Profile: PF 1
Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Re: **Addendum No. 2 to Update No. 2 to the Technical Drainage Study for Elkhorn Drive from 961.82 feet East of Simmons Street to Clayton Street**
CNLV No. 26574; GCW No. 590.211.613Q

Dear Mr. Monroe:

Staff has reviewed the above referenced study, dated October 5, 2006, and found it to meet the minimum accepted standards for a technical drainage study. This acceptance is contingent upon the following conditions:

1. Concurrence must be obtained by the Clark County Regional Flood Control District due to the proposed improvements proximity to Regional Flood Control Facilities.

2. Concurrence must be obtained by the Clark County Public Works due to the proposed improvements proximity to 215 Beltway right-of-way.

Please be advised that all land surface area disturbances over 1 acre and/or adjacent to a water way must submit a "Notice of Intent" to discharge to the Nevada Division of Environmental Protection, which certifies that a stormwater pollution prevention plan has been developed and is maintained on site. For more information, including forms and applications, see http://ndep.nv.gov/bwpc/storm01.htm.

Acceptance of this drainage study does not imply approval of the grading plan or the structural calculations associated with the drainage for this site. A detailed review of the grading plan is performed by staff during the improvement plan review process.

The City assumes no responsibility for the information, data, and conclusions presented in this report. If you have any questions concerning this matter, please contact me at 633-1223.

Sincerely,

Jennifer E. Doody, PE CFM
Senior Engineer
Development and Flood Control Division

Peter Jackson	CLV	pjackson@lasvegasnevada.gov, 229-5266
Phil Miller	Crescent Bay	developaz@gmail.com, 408-215-1780
Mike Ross	Mike Ross Advisors	Mike@mikerossadvisors.com, 743-3928
Mark Failla	SHG	MFailla@shg-inc.com, 284-5300
Kellin Collins	Pardee Homes	KCollins@shg-inc.com, 284-5300

Meeting Notes:

Item:	*Discussion:*
1	**Project Scope** – This Master Plan Amendment (MPA) is prepared to only address the new Park Highlands West (PHW) by SHG. It will assume the existing (previously approved) Park Highlands East (PHE) land plan and drainage pattern. A future separate MPA will be prepared to address the new PHE land plan and drainage pattern. This MPA will address the downstream impacts due to the PHW facilities. Phil Miller and Mike Ross mentioned that the split of PHW and PHE will be at the CNLV Council on May 21st. Steve Parrish would prefer a single MPA addressing both PHW and PHE but will be okay with two separate MPA. SHG explained that the land plan for PHE is still in flux and the developers of PHW do not want to wait. The CNLV and CLV are okay with two separate MPAs.
2	**Horse Alignment** – The proposed Horse Alignment extends from Decatur to the Las Vegas Wash and would replace the proposed facility in Decatur between Horse and Grand Teton. Phil Miller and Mike Ross highlighted that the BLM easement application was filed by the CNLV today (4/24/14). The question was posed as to the adoption of the MPA prior to obtaining the BLM easement for the Horse alignment. • CCRFCD hesitates to adopt or present to the Board an alignment in which an easement is not guaranteed. Steve Parrish is concerned about removing a facility (along Decatur) that can be built today with one that may not be built if the easement is not granted. • Mike Ross presented that the current Conservation Transfer Area (CTA) documents state that the CTA must respect and consider the planned CCRFCD MPU facilities within the CTA. Even without the BLM easement for the Horse Alignment, if the MPA is adopted with the Horse Alignment then the CTA will have to accept the easement request. • SHG/Developer thinks the adoption of the MPA will add credibility to acceptance of BLM Easement. • Peter Jackson explained that the CLV and CNLV are currently struggling with the BLM because they have

Prepared By: K. Collins

Please notify the preparer if you have any questions, concerns or additions to these minutes within 2 days. After 2 days the content of this document will be considered accurate and accepted as the final recordation.

Item:	Discussion:
	not provided any consideration of the planned regional facilities within the CTA. Peter Jackson does not think by just getting MPA adopted with the Horse Alignment that it will necessarily force BLM to accept easement/alignment. If the easement is granted then there would be no problem. • The consensus of all reviewing agency was that the BLM easement must be in place for the MPA to be accepted and adopted with the Horse Alignment. An potential alternative suggested by Phil Miller includes the following (now known as the Aviary Alignment): • Remove the proposed dog park in the detention basin as the dog park is not required of the PHW development agreement (DA) to obtain additional storage. • Route the flows from the intersection of Horse/Aviary south into the proposed detention basin. This will avoid the upsizing of the proposed Grand Teton facility between Decatur and Aviary. This will avoid the need for the BLM easement for the Horse Alignment. • The proposed Aviary facility will discharge directly into the proposed detention basin and not tie into the Grand Teton facility. Note that the current local Aviary facility ties into the Grand Teton facility, this connection would be removed. Phil Miller suggest the following steps me made by SHG: • Establish that the proposed detention basin has capacity with the removal of the dog park for the Horse/Aviary flow. • Should the detention basin have capacity for the Aviary Alignment flow and the Aviary Alignment is pursued then an update will be prepared • Dan Le requested that the Update to the PH GT TDS be approved by CNLV and concurred by CLV and CCRFCD before perusing the MPA. • Phil Miller requested that the Updates and the MPA be review concurrently by all agencies. • Should the BLM easement be granted by the time the PHE MPA is in progress, as part of the PHE MPA is the removal of the Aviary alignment and the proposal of the Horse alignment to the Las Vegas Wash. If the Horse Alignment is pursued, CCRFCD request the following: • The existing natural wash (Facility E3) be delineated on the F and H maps with 2 lines, similar to the presentation of the Las Vegas Wash. • The existing natural wash (Facility E3) be evaluated for capacity of the flow rate.
3	**Drainage Pattern** – The following was a consensus of the attendees: • Good idea to assume the 30cfs that currently routes south in Decatur from Horse will be kept in Horse with the regional facility in Horse. • The preferred drainage pattern (independent of necessary easement and conflict with the CTA) is the Horse Alignment. This will address the ponding problem at the Horse/Decatur intersection and provide an outlet from the Horse/Aliante intersection. • The newly suggested Aviary Alignment will still address the ponding problem with the Horse/Decatur intersection. It reduces the flows to the Horse/Aliante intersection but it does not address the flows that still get to the intersection.
4	**Points of Comparison/Limit of Analysis** – The limit of analysis will be based on showing no adverse impacts to existing and planned regional facilities.
5	**Proposed Facilities: Category A vs. B** – Steve Parrish wants the proposed facility in Grand Teton and thru the PHW site be a Category A facility. CCRFCD requested that the line for the Grand Teton facility on the F and H maps only extend to the current facility design.
6	**Existing Golf Course thru Aliante** – SHG asked if the existing golf course channel can have one ID with the description being "golf course channel." The following was a result of this question: • CCRFCD will not provide funding for the maintenance of the golf course. • CCRFCD stated that the golf course channel segments may be dictated by who maintains it. • There may be a need for an agreement on the maintenance funding of the golf course channel between CCRFCD and CNLV. • CCRFCD requires that geometry be provided for the existing golf course channel with the MPA.
7	**Entity Coordination/Schedule** – CNLV (Peter Jackson) and CLV (Dan Le) are okay with reviewing the MPA concurrently. No fees are required. Peter Jackson mentioned that should they have any comments/concerns, it will

Prepared By: K. Collins

Please notify the preparer if you have any questions, concerns or additions to these minutes within 2 days. After 2 days the content of this document will be considered accurate and accepted as the final recordation.

Item:	*Discussion:*
	be forwarded to the CNLV to be incorporated in their comment letter. CLV will not be issuing their own comment letter. CCRFCD questioned if County even needs to review the MPA if there are no changes to the County facilities.
8	**Additional Items to Note –** • It would not be appropriate to propose a detention with the MPA that would require an upsize. • SHG can consider keeping the Decatur facility and proposing a parallel facility in Grand Teton to the proposed detention basin.

Action Items:

Item:	*Person:*	*Comments:*
1	Kellin/Mark	Determine whether the proposed PHW detention basin with the removal of the dog park will have capacity for the additional flows from the Horse/Aviary intersection. Should the proposed PHW detention basin have capacity: • Determine the necessary changes • Determine schedule for the Update to the PHW MDS and PH GT TDS • Discuss with client on necessary changes and schedules
2	Developer	Determine which alignment to pursue.
3	Kellin	Coordinate with Clark County if they would be interested in reviewing the MPA since they were not in attendance to this meeting.
4	Kellin	Send a PDF of improvement plans for the Decatur/Grand Teton intersection to Peter Jackson at the CLV.
5	Dan	Revise the current approval letters for PHW MDS and PH GT TDS to remove Park Highlands East from the required MPA.
6	Dan	Research to determine the current responsible party for the maintenance of the golf course channel.
7	Dan	Schedule a follow-up meeting to discuss the existing Aliante Golf Course facility(s) with CNLV and CCRFCD to establish any required document/agreement between CCRFCD and CNLV on the maintenance and funding
8	Kellin/Mark	Based on the CNLV and CCRFCD meeting on the Aliante golf course facility, obtain a consensus on how many segments of regional facilities with ID will be required.

Prepared By: K. Collins

Meeting Notes:

Item:	*Discussion:*
1	**Project Scope** – Park Highlands West (PHW) and Park Highlands East (PHE) are projects located in the CNLV. The original intent of the Master Plan Amendment (MPA_ was to address regional changes due to the two developments. The two developments are planned to be split. This MPA is prepared to only address the new PHW by SHG. It will assume the existing (previously approved) PHE land plan and drainage pattern. A future separate MPA will be prepared to address the new PHE land plan and drainage pattern. This MPA will address the downstream impacts due to the PHW facilities. The proposed regional facility alignment ties into the Clark County Beltway storm drain system.
2	**CC Review of the MPA** – SHG inquired as to whether Clark County wants to review the PHW MPA. Clark County is not sure at this time and requires additional information for coordination with other members of Clark County to determine whether Clark County needs to review the PHW MPA.

Action Items:

Item:	*Person:*	*Comments:*
1	Kellin	E-mail Layne Weber with a PDF of the proposed MPU changes
2	Layne	Coordinate with others at CCPW as to whether they are interested in reviewing the PHW MPA. If County wants to review the PHW MPA, determine if they will review it concurrently with CNLV and CLV.

MEETING MINUTES

Project Number: CBH1301.002
Project Name: Park Highlands West MPU Amendment
Meeting Date: April 29, 2014 @ 9:00AM
Meeting Location: CNLV
Meeting Topic: Park Highlands West MPU Amendment

Attendees:	*Company Name:*	*Contact Info (email/phone)*
Jennifer Doody	CNLV	doodyj@cityofnorthlasvegas.com, 633-1233
Dan Le	CNLV	LeD@cityofnorthlasvegas.com, 633-1932
Mark Failla	SHG	MFailla@shg-inc.com, 284-5300
Kellin Collins	Pardee Homes	KCollins@shg-inc.com, 284-5300

Meeting Notes:

Item:	*Discussion:*
1	**Went over discussion items of the technical workshop on 4/24 –** Project Scope - This Master Plan Amendment (MPA) is prepared to only address the new Park Highlands West (PHW) by SHG. It will assume the existing (previously approved) Park Highlands East (PHE) land plan and drainage pattern. A future separate MPA will be prepared to address the new PHE land plan and drainage pattern. This MPA will address the downstream impacts due to the PHW facilities. Horse Alignment: The proposed Horse alignment extends from Decatur to the Las Vegas Wash and would replace the proposed facility in Decatur between Horse and Grand Teton. The question was posed as to the adoption of the MPA prior to obtaining the BLM easement for the Horse alignment. • CCRFCD hesitates to adopt or present to the Board for a regional facility alignment in which an easement is not guaranteed. Steve Parrish is concerned about removing a facility (along Decatur) that can be built today with one that may not be if the easement is not granted. • Mike Ross presented that the current Conservation Transfer Area (CTA) documents states that the CTA must respect and consider all planned CCRFCD MPU facilities within the CTA. Even without the BLM easement for the Horse alignment, if the MPA is adopted then the CTA will have to accept the Horse alignment. • Peter Jackson explained that the CLV and CNLV are currently struggling with the BLM because they have no consideration of all the planned CCRFCD MPU facilities within the CTA. Peter does not think by just getting MPA adopted will necessarily force BLM to accept easement/alignment. If the easement is granted then there would be no problem. • SHG/Developed thinks the adoption of the MPA will add credibility to acceptance of BLM Easement • The consensus of all reviewing agency was that the BLM easement must be in place for the MPA to be accepted and adopted. A potential alternative suggested by Phil Miller includes the following (now known as the Aviary Alignment): • Remove the proposed dog park in the detention basin as the dog park is not required of the PHW development agreement (DA) to obtain additional storage. • Route the flows from the intersection of Horse/Aviary south into the proposed detention basin. This will avoid the upsizing of the proposed Grand Teton facility between Decatur and Aviary. This will avoid the need for the BLM easement for the Horse Alignment.

Prepared By: K. Collins

Please notify the preparer if you have any questions, concerns or additions to these minutes within 2 days. After 2 days the content of this document will be considered accurate and accepted as the final recordation.

Item:	*Discussion:*
	• The proposed Aviary facility will discharge directly into the proposed detention basin and not tie into the Grand Teton facility. Note that the current local Aviary facility ties into the Grand Teton facility, this connection would be removed. Drainage Pattern – The following was a consensus of the attendees: • Good idea to assume the 30cfs that currently routes south in Decatur from Horse will be kept in Horse with the regional facility in Horse. • The preferred drainage pattern (independent of necessary easement and conflict with the CTA) is the Horse Alignment. This will address the ponding problem at the Horse/Decatur intersection and provide an outlet from the Horse/Aliante intersection. • The newly suggested Aviary Alignment will still address the ponding problem with the Horse/Decatur intersection. It reduces the flows to the Horse/Aliante intersection but it does not address the flows that still get to the intersection. Proposed Facilities: Category A vs. B – Steve Parrish wants the proposed facility in Grand Teton and thru the PHW site be a Category A facility. Existing Golf Course thru Aliante – SHG asked if the existing golf course channel can have one ID with the description being "golf course channel." The following was a result of this question: • CCRFCD will not provide funding for the maintenance of the golf course. • CCRFCD stated that the golf course channel segments may be dictated by who maintains it. • There may be a need for an agreement on the maintenance of the golf course channel between CCRFCD and CNLV. Existing Golf Course thru Aliante – CNLV and CLV is willing to review the MPA concurrently without any fees. It is still uncertain at this time if CCPW will review the MPA.
2	**Horse Alignment vs. Aviary Alignment vs. Decatur Alignment** – It is unclear at this time whether the developer will take the risk associated with the Horse Alignment and continue with the MPA. The developer may pursue an alternate alignment (Decatur Alignment or Aviary Alignment) that will avoid the CTA and BLM easement which would result in an Update to the PH GT TDS and PHW MDS. SHG is currently looking into the extra storage volume available with the removal of the dog park within the proposed detention basin. SHG is looking into Decatur Alignment and Aviary Alignment: as to the additional flow to the Grand Teton system, the potential upsize of the Grand Teton system, and capacity of the detention basin. Jennifer Doody is okay with the removal of the dog park as long as CNLV Planning is okay with the removal. Jennifer is also okay with the two alternative alignments. It was noted that if the Decatur or Aviary Alignment is selected for the MPA, the CNLV will still pursue the BLM easement to address the outlet at Horse/Aliante. Depending on the timing of the BLM easement, if it is obtained prior to the start of the PHE MPA, the CNLV will request the removal of the planned Decatur or Aviary Alignment and replace it with the Horse Alignment.
3	**Aliante Golf Course** – Jennifer Doody stated that the golf course and the culvert crossings are public facilities and maintained by the CNLV. Dan Le mentioned that he had recently received a phone call from Steve Parrish at CCRFCD to schedule a meeting on the maintenance and funding of the maintenance for the existing golf course. Jennifer Doody mentioned that she is okay with establishing a maintenance agreement and that the CNLV will only request money to maintain flood components once it becomes a regional alignment.
4	**CNLV Coordination/Schedule** – Should the proposed detention basin with the removal of the dog park have capacity for the addition flows from Horse (whether from Decatur or Aviary), will the CNLV be willing to review the updates to the PH GT TDS and PHW MDS concurrently with the MPA. Jennifer Doody will permit the submittal of the MPA for review after the first review of the update to the PH GT TDS. Dan asked about the review of the update to the PG GT TDS vs. the review of the PHE MDS currently in queue for review. Mark Failla stated that the PHW and the PH GT facility have priority over PHE. Therefore, depending when the update is submitted (if before the PHE MDS is under review) SHG/developer may request that the update replace the spot of the PHE MDS in the queue.

Prepared By: K. Collins

Please notify the preparer if you have any questions, concerns or additions to these minutes within 2 days. After 2 days the content of this document will be considered accurate and accepted as the final recordation.

Item:	*Discussion:*
5	**Additional Items to Note –** • For all Park Highlands meetings invite Jennifer Doody as well as Rob McLaughlin until told otherwise by the CNLV. • Jennifer Doody was okay with 2 separate MPA. • If the Aviary Alignment is feasible and selected for the MPA, CNLV request to have it classified as a Category A in the MPA. • Jennifer is okay with the Grand Teton facility being a Category B as requested by CCRFCD. • CNLV mentioned that any proposed beautification of the proposed detention basin needs to be included in the improvement plans of the detention basin. CNLV wants to insure that any proposed landscaping will not impact the function of the detention basin. • Before CNLV can approve anything onsite, civil plans for the Grand Teton facility must be approved.

Action Items:

Item:	*Person:*	*Comments:*
1	Kellin/Mark	Determine whether the proposed PHW detention basin with the removal of the dog park bench will have capacity for the additional flows from the Horse/Aviary intersection. Should the proposed PHW detention basin have capacity: • Determine the necessary changes • Determine schedule for the Update to the PHW MDS and PH GT TDS and discuss with client
2	Developer	Determine which alignment to pursue.
3	Kellin/Dan	Verify the current utilities within Aviary between Horse and Grand Teton for the constructability of that storm drain alignment.
4	Dan	Schedule a follow-up meeting to discuss the existing Aliante Golf Course facility(s) with CNLV and CCRFCD to establish any required document/agreement between CCRFCD and CNLV on the maintenance and funding
5	Kellin/Mark	Based on the CNLV and CCRFCD meeting on the Aliante golf course facility, obtain a consensus on how many segments of regional facilities with ID will be required.

Subject: RE: Park Highlands East MPA

Jennifer.
Great. We will move forward with associated revisions to the MPA and when complete swap it out with the previously submitted version. Per my discussion with Mike Walline, it is understood and acceptable that this alternative will include any necessary facility sizing revisions to the Grand Teton Facility to be designed and constructed by Park Highlands West. An update technical study for the Grand Teton facility will follow the revised MPA.

I want to thank everyone involved for working to resolve this issue in an expeditious manner!

Mark

Subject: Park Highlands East MPA

Hi, Mark! I talked to Regional Flood this morning and they are ok with the Aviary alignment with the understanding that the portion of the facility crossing Grand Teton will be constructed by Park Highlands sized adequately to convey the flow from the future Aviary facility.

Let me know if you need anything else from us on this item.

Thanks!

Jennifer

Hi Kellin,

The submitted info. seems to be adequate in addressing the lack of 2' of freeboard for the existing RCBs under Lintwhite . Therefore, please proceed with revising the MPA that was submitted back on December 2014 to reflect this info. Thanks

On Thu, Feb 4, 2016 at 1:03 PM, Kellin Collins <kcollins@shg-inc.com> wrote:

All,

Attached is discussion with supporting computations and referenced improvement plans on the two existing culverts in question. Please take a look and at your earliest convenience, provide input on the acceptability of the information. Call or e-mail if you have any questions or concerns. Thank you.

The Park Highlands West (PHW) Amendment has shown a quantitative (cost) benefit to the community by altering a regional alignment along Grand Teton to reduce construction cost of planned future facilities and by utilizing existing drainage infrastructure thru the Aliante community. During agency review of the MPA submitted in coordination with the project, CCRFCD and CNLV requested additional information regarding the adequacy of two existing culvert facilities within the Aliante Community affected by the MPA. The existing facilities (culverts at Night Heron and Lintwhite) in question of status (existing vs. remove/replace) were originally proposed as local facilities; therefore, were not designed to meet the regional facility criteria of providing 2-feet of freeboard below the culvert low cord. It is noted that the facilities were required to be designed in accordance with the CCRFCD Manual and gained approval from CNLV and concurrence from CCRFCD.

Although the facilities were not designed to meet the regional facility criteria identified above, the PHW Amendment flow rates to these culverts show a reduction in 100-year peak flow as compared to the design flow rates. With the PHW Amendment flow rates, the culvert at Night Heron meets the regional criteria of 2' below low cord but the culvert at Lintwhite does not. The flow depth within the Lintwhite culvert is 0.72' below the low cord of the RCBs which is lacking 1.28' of freeboard to meet regional facility criteria. Outside of criteria, the flow depths through each set of culverts are below the low cord of the RCBs. When looking at the culvert and roadway elevation at Lintwhite, there is additional freeboard above the culvert's low cord (approx. 6.6') before flows overtop the roadway and has potential to impact the adjacent finished floors. The available freeboard prior to overtopping the road and impact to adjacent road/property provides a culvert capacity of 1,170 cfs which is 2 times the computed impacting 100-year peak flow rate.

The following provides information relevant to the two existing culverts:

General information of the two existing culvert crossings:

- At Night Heron, there are (2) 10'x5' RCBs at 0.50% with 344 cfs. The roadway is located approximately 3.9' above the culvert's low cord.
- At Lintwhite, there are (5) 6'x3' RCBs at 0.50% with 570 cfs. The roadway is located approximately 6.6' above the culvert's low cord.

Design components of the two existing culvert crossings:

- The (2) 10'x5' RCBs at 0.50% was originally designed with 514 cfs.
- The (5) 6'x3' RCBs at 0.50% was originally designed with 705 cfs.

Based on the Manning's equation with computed MPA flow rates:

- The flow depth in the (2) 10'x5' RCBs is 1.96', which is 3.04' below the low cord of the RCBs.
- The flow depth in the (5) 6'x3' RCBs is 2.28', which is 0.72' below the low cord of the RCBs.

Summary:

- At Night Heron the original facility design flow was 514 cfs. The computed 100-year peak regional flow is 344 cfs.
- At Lintwhite the original facility design flow was 705 cfs. The computed 100-year peak regional flow is 570 cfs.
- At Lintwhite, 0.72-feet of freeboard is provided below the culvert low chord. This is less than the regionally required 2-feet. However, when looking at the culvert and roadway elevation at Lintwhite, there is additional freeboard above the culvert's low cord (approx. 6.6') before flows overtop the roadway and has potential to impact the adjacent finished floors. The available freeboard prior to overtopping the road and impact to adjacent road/property provides a culvert capacity of 1,170 cfs which is 2 times the computed impacting 100-year peak flow rate.

Given that the PHW Amendment has shown a cost benefit to the community, and there is no failure or a high risk of flows overtopping the existing culvert at Lintwhite to adversely impact the adjacent finished floors, it is requested that the culvert at Lintwhite be shown only as an 'existing' regional facility in the Amendment and not a 'remove and replace' regional facility.

Abi,

I was wondering if you had a chance to look at the material I sent over on the existing Aliante culverts. I've attached the material to this e-mail for conveyance. Please let me know if you have any questions or concerns.

DISTRICT COMMENT(S): **PARK HIGHLANDS WEST AMENDMENT TO THE 2013 LAS VEGAS VALLEY FLOOD CONTROL MASTER PLAN UPDATE**

Dear Mr. Le:

Clark County Regional Flood Control District (District) completed a review of the *Park Highlands West Amendment to the 2013 Las Vegas Valley Flood Control Master Plan Update* (MPA) received on May18, 2015, prepared by Slater Hanifan Group for City of North Las Vegas (CNLV). In addition, District is in receipt of the Conditional Letter of Acceptance from City of North Las Vegas Public Works dated May 6, 2015 and from City of Las Vegas Public Works (CLV) dated May 14, 2015.

District has the following comment(s):

1. The MPA proposes to add existing drainage facilities within the Aliante Golf Course to the District's Master Plan Update (MPU). As discussed in previous meetings, only flood control components through the Golf Course shall be eligible for District maintenance funding. A maintenance agreement between the District and CNLV detailing maintenance funding for the flood control components must be fully developed and agreed to within six (6) months following the approval of the MPA. Address all weather access and operation and maintenance requirements of the Golf Course.

2. Based on the *Master Drainage Study for Park Highlands West*, the maximum allowable capacity/design flow of the Golf Course is 512 cfs. The MPA identifies 742 cfs to be conveyed through the Golf Course, which exceeds the allowable capacity of the existing facilities. The MPA must demonstrate and identify appropriate facilities such that there is no adverse impact to existing downstream facilities. Address accordingly.

3. Provide a discussion in the report regarding meeting the allowable drain time of the proposed detention basin through the Golf Course, PMF design requirements, back-to-back design storm capacity and spillway design parameters.

4. Verify the sizes of the existing culverts and channels within the Golf Course and ensure there is adequate capacity through the facilities. Account for existing trash racks/clogging factor in the capacity calculation. Discuss inundation limits along the rip-rap and grass lined channels. Provide reference plan of existing facilities.

600 S. Grand Central Parkway, Suite 300 • Las Vegas, Nevada 89106-4511
(702) 685-0000 • FAX: (702) 685-0001
Website: *http://www.regionalflood.org*

5. The proposed MPA alignment is to convey flow across Aliante Parkway and Broadwing Drive through existing culverts. The alignment includes a 90-degree turn and a possible flow split upstream of the Aliante Parkway crossing. Provide hydraulic calculations demonstrating that the flow can be safely conveyed along the proposed alignment and address if a future Technical Drainage Study for the existing Golf Course facilities will be submitted for review. Address accordingly.

6. The removal of the Grand Teton alignment between Aviary Way and Las Vegas Wash impacts the Park Highlands East development. Provide a discussion in the report regarding impacts of removing the alignment and flood control requirements that must be addressed by Park Highlands East.

7. Clark County Public Works (CCPW) I-215 Beltway facilities are adjacent/affected by the MPA. CCPW concurrence must be obtained prior to District's approval of the MPA.

8. The MPA must incorporate revisions from *Update #2 to the Park Highlands Grand Teton Regional Flood Control Facility* since it includes updated basin parameters. Revise HEC-1 models accordingly. Provide appropriate reference materials from the update.

9. There are incorrect ID miles of proposed facilities on the HEC-1 models. Thoroughly review the updated sections and revise accordingly (e.g., Model WEST3r, Line 3718 is missing ID mile reference, Line 3773 GTEA 0234 should be 0236, Park Highlands West Detention Basin ID miles do not match F-Sheets). Verify routing lengths and revise as necessary.

10. Subbasin boundaries, land use and other changes as outlined in Appendix I of the report must be discussed in the body of the report. Revise accordingly.

11. MPU F & H Sheets:
    a. For ease of reference of proposed revisions, provide annotated F & H Sheets showing deleted, added and revised facilities, subbasins, flow splits and flow direction.

    b. The appropriate "HEC-1 model" name presented by the MPA must be indicated on the Facility Inventory Tables, F-Sheets (e.g., "WEST3r"). Provide orifice opening size of the 72" RCP outlet (GTEA 0141) facility on the table.
    c. Labels of existing facilities should be denoted by blue text (e.g., LVMD 2490). Revise exhibit accordingly.

    d. There are incorrect values on the Facility Sizing Tool spreadsheet. Review all sizes and revise accordingly (e.g., AVHR 0094 height and width should be should

be 12' and 3' instead of 13' and 2', GTEA 0236 height should be 5', instead of 4'). Address any impacts to the MPA.

12. The estimated facility cost reported on the 2013 Master Plan Update included a factor of 0.773 applied to the value calculated by the Cost Tool program. For cost comparison consistency, apply the 0.773 factor to the Cost Tool values. Revise applicable tables in the report accordingly.

13. The first paragraph on Page 11 identifies ID Mile LVUP 0668, which does not exist on the MPU. Delete paragraph or clarify.

14. Provide GIS shape files with the next submittal.

15. District requests a pre-fabricated building for the flood threat recognition monitoring station at the proposed detention basin. Contact District staff for the design plan of the building.

If you have any questions, please give us a call.

Las Vegas, Nevada 89106-4511

Subject: Park Highlands West Amendment to the 2013 Las Vegas Valley Flood Control Master Plan Update

Dear Ms. Mayrena:

This letter is submitted in response to comments contained in the June 8, 2015 Clark County Regional Flood Control District (CCRFCD) comment letter regarding the above referenced project. Note that a coordination meeting was held on June 29, 2015 with CCRFCD and City of North Las Vegas (CNLV) to discuss the comments. The comments have been individually addressed as follows:

1. **Comment:** *The MPA proposes to add existing drainage facilities within the Aliante Golf Course to the District's Master Plan Update (MPU). As discussed in previous meetings, only flood control components through the Golf Course shall be eligible for District maintenance funding. A maintenance agreement between the District and CNLV detailing maintenance funding for the flood control components must be fully developed and agreed to within six (6) months following the approval of the MPA. Address all weather access and operation and maintenance requirements of the Golf Course.*

   Response: Per the June 29, 2015 coordination meeting, CNLV will prepare and coordinate the maintenance agreement with CCRFCD within the specified time frame. The maintenance agreement will be inclusive of detailing maintenance funding for flood control components, addressing all weather access, and operation and maintenance requirements. Slater Hanifan Group (SHG) will provide any necessary supporting information to assist in the process at the request of CNLV.

2. **Comment:** *Based on the Master Drainage Study for Park Highlands West, the maximum allowable capacity/design flow of the Golf Course is 512 cfs. The MPA identifies 742 cfs to be conveyed through the Golf Course, which exceeds the allowable capacity of the existing facilities. The MPA must demonstrate and identify appropriate facilities such that there is no adverse impact to existing downstream facilities. Address accordingly.*

   Response: The hydrologic modeling as provided with this Amendment establishes flow rates at two locations relevant to the Aliante golf course and community. Concentration Point CNN033-C located at the upstream end of the golf course at the Park Highlands West/Aliante property line identifies a 100-year flow rate of 344 cfs. Concentration Point CNN048-C located at the downstream end of the golf course/Aliante community at the connection to the I-215 Beltway drainage facility identifies a 100-year flow rate of 743 cfs.

With this comment, it has been identified that no runoff generated from the Aliante community contributes to regional facilities GTEA 0096 and GTEA 0095. Consequently, for purposes of this Amendment the concentration point and associated flow rate for those two facilities have been revised to HEC-1 Node CNN033-C and 344 cfs. Concentration Point CNN048-C and associated flow rate of 743 has been utilized for regional facilities GTEA 0078 thru GTEA 0000. The following table provides a comparison of the Amendment, design and capacity flow rate for each regional facility within the Aliante golf course and community.

Existing Aliante Facility - Flow Rate Comparison Table			
Facility ID	**Amendment Flow Rate (cfs)**	**Design Flow Rate (cfs)**	**Capacity Flow Rate* (cfs)**
GTEA 0096	344	514	1,303
GTEA 0095	344	514	999
GTEA 0078	743	528 / 532	806
GTEA 0075	743	532	2,835
GTEA 0073	743	532	1,647
GTEA 0072	743	532	2,835
GTEA 0058	743	705	1,367
GTEA 0056	743	705	640
GTEA 0042	743	705 / 770	1,497
GTEA 0038	743	751	2,235
GTEA 0000	743	751	1,025

*Capacity flow rate is determined by the MPU Sizing Tool.

The following should be noted in reviewing the Existing Aliante Facility - Flow Rate Comparison Table:

- The values in the 'Design Flow Rate' column are referenced from previously approved technical drainage studies. Refer response to Comment No. 4 for additional discussion on each of the referenced drainage studies.
- For facilities GTEA 0078 and GTEA 0042 there are two design flow rates listed because there is a different design flow rate for the upstream half verses the downstream half of the facility. Note that the higher flow rate is for the downstream half of the facility.
- The values in the 'Capacity Flow Rate column are obtained from the MPU Sizing Tool. Since these facilities are existing infrastructures, the MPU Sizing Tool is utilized to validate the facility capacity.
- For all the facilities in the table, with the exception of GTEA 0056, the capacity flow rate is greater than both the Amendment and design flow rate. Therefore, there is no adverse impacts to any of those facilities.
- For facility GTEA 0056, the capacity as determined by the MPU Sizing Tool is inclusive of 2-ft of freeboard. Without consideration to the 2-ft of freeboard, per the referenced technical study, the facility has capacity to convey 705 cfs. As part of this Amendment, additional drainage infrastructure is identified for facilities not in compliance with MPU criteria. A future remove and replacement of facility GTEA 0056 is proposed. Future facility GTEA 0057 (replacing GTEA 0056) accommodates the MPU freeboard criteria (HGL 2-ft belpw bridge/culvert low cord).

Refer to the Existing Aliante Drainage Facility Design Flow Rate Inventory Map for an annotated exhibit of the facility location with their associated design flow rates. Note that the 512 cfs reported in this comment as the limiting golf course flow is obtained from the Master Update 2, which referenced the Conceptual Drainage Study for Aliante. The Existing Aliante Facility - Flow Rate Comparison Table reports a flow rate of 514 cfs which is referenced from a technical drainage study for the golf course infrastructure.

3. **Comment:** *Provide a discussion in the report regarding meeting the allowable drain time of the proposed detention basin through the Golf Course, PMF design requirements, back-to-back design storm capacity and spillway design parameters.*

   Response: Discussion has been incorporated into the report with regards to the allowable drain time of the proposed detention basin through the Golf Course, PMF design requirements, back-to-back design storm capacity and spillway design parameters. Please see Section 3.1.2 of the updated Amendment for the discussion.

4. **Comment:** *Verify the sizes of the existing culverts and channels within the Golf Course and ensure there is adequate capacity through the facilities. Account for existing trash racks/clogging factor in the capacity calculation. Discuss inundation limits along the rip-rap and grass lined channels. Provide reference plan of existing facilities.*

   Response: Per coordination meeting on June 29, 2015, it was agreed that SHG will prepare an exhibit with an inventory of the existing facilities and associated design flows with comparison to flow rates determined as part of this Amendment in order to address this comment. Per the meeting and coordination, besides the CCRFCD Sizing Tool utilized for verifying facility capacities based on MPU criteria, no additional detailed hydraulic computations to verify facility capacities and incorporating trash rack/clogging factors, bends, etc. are required. Four approved drainage studies have been referenced for inventory of the existing facilities and design flows and are listed as follows:

   - *Technical Drainage Study for Swing Parcel Channel* (hereafter referred to as Swing Channel Study) approved by CNLV on June 19, 2003. The Swing Channel Study provides the hydraulic assessment of facility GTEA 0096 proposed with this Amendment.
   - *Technical Drainage Study for Club Aliante* (hereafter referred to as Club Study) approved by CNLV on February 19, 2004. The Club Study provides the hydraulic assessment of facility GTEA 0095 proposed with this Amendment.
   - *Technical Drainage Study for Aliante Golf Course* (hereafter referred to as the Golf Course Study) approved by CNLV on December 4, 2002. The Golf Course Study provides the hydraulic assessment of facilities GTEA 0078, 0075, 0073, 0072, 0058, 0057, and 0042 proposed with this Amendment. The referenced hydraulic analysis establishes the limit of inundation along the golf course.
   - *Update #2 to the Technical Drainage Study for Elkhorn Drive* (hereafter referred to as Elkhorn Update2) approved by CNLV on November 1, 2006. The Elkhorn Update2 provides the hydraulic assessment of facilities GTEA 0038 and 0000 proposed with this Amendment.

   All relevant reference materials in response to this Comment No. 4 have been provided in Appendix H. Also provided in Appendix A is Exhibit D illustrating the regional facilities proposed with this Amendment thru the Aliante community with the flow rate established by

the referenced hydraulic assessments compared the MPU Sizing Tool and this Amendment's flow rates. See response to Comment No. 2 for discussion regarding existing facility design flow, capacity and MPA flow.

It is noted that the infrastructure placed at the outlet of the dual RCB crossing Night Heron Way (GTEA 0095), per coordination with CNLV, is not a trash rack. It is a collapsible grate to prevent unwanted access into the flood control facility. The reference computations do not account for a clogging factor of the collapsible grate.

5. **Comment:** *The proposed MPA alignment is to convey flow across Aliante Parkway and Broadwing Drive through existing culverts. The alignment includes a 90-degree turn and a possible flow split upstream of the Aliante Parkway crossing. Provide hydraulic calculations demonstrating that the flow can be safely conveyed along the proposed alignment and address if a future Technical Drainage Study for the existing Golf Course facilities will be submitted for review. Address accordingly.*

   Response: It is noted that the referenced analysis for golf course did not address the flows turning 90 degree at the northeast corner of Broadwing Drive and Aliante Parkway. However should any flows overtop the high point in the golf cart path, there is another culvert (54" RCP) crossing under Broadwing Drive that would route the flows to the same location in the golf course channel just south of Broadwing Drive.

   As for the cart path crossing under Redhead Drive just west of Aliante Parkway, the culvert drains from a south to north direction. Therefore, there is no flow split occurring at this location.

   For additional discussion on the existing facility design, please see response to Comments No. 4 and No. 2.

6. **Comment:** *The removal of the Grand Teton alignment between Aviary Way and Las Vegas Wash impacts the Park Highlands East development. Provide a discussion in the report regarding impacts of removing the alignment and flood control requirements that must be addressed by Park Highlands East.*

   Response: Discussion has been incorporated into the report with regards to the impacts to the Villages at Tule Springs (previously known as Park Highlands East) with the removal of the Grand Teton alignment between Aviary Way and Las Vegas Wash. Please see Section 2.2 of the updated Amendment for the discussion.

7. **Comment:** *Clark County Public Works (CCPW) I-215 Beltway facilities are adjacent/affected by the MPA. CCPW concurrence must be obtained prior to District's approval of the MPA.*

   Response: Noted, CCPW concurrence will be pursued.

8. **Comment:** *The MPA must incorporate revisions from Update #2 to the Park Highlands Grand Teton Regional Flood Control Facility since it includes updated basin parameters. Revise HEC-1 models accordingly. Provide appropriate reference materials from the update.*

   Response: The Amendment discussion and HEC-1 models have been revised to reflect the Update No. 2 to the Master Drainage Study for Park Highlands West. The relevant reference material has been provided in Appendix G.

9. **Comment:** *There are incorrect ID miles of proposed facilities on the HEC-1 models. Thoroughly review the updated sections and revise accordingly (e.g., Model WEST3r, Line 3718 is missing ID mile reference, Line 3773 GTEA 0234 should be 0236, Park Highlands West Detention Basin ID miles do not match F-Sheets). Verify routing lengths and revise as necessary.*

   Response: The ID miles have been corrected in the HEC-1 models and the routing lengths have been verified.

10. **Comment:** *Subbasin boundaries, land use and other changes as outlined in Appendix I of the report must be discussed in the body of the report. Revise accordingly.*

    Response: The changes outlined in previous Appendix I have been incorporated into the report discussion. Refer to Section 2.2 of the updated Amendment for the discussion.

11. **Comment:** *MPU F & H Sheets:*

    a. *For ease of reference of proposed revisions, provide annotated F & H Sheets showing deleted, added and revised facilities, subbasins, flow splits and flow direction.*

    b. *The appropriate "HEC-1 model" name presented by the MPA must be indicated on the Facility Inventory Tables, F-Sheets (e.g., "WEST3r"). Provide orifice opening size of the 72" RCP outlet (GTEA 0141) facility on the table.*

    c. *Labels of existing facilities should be denoted by blue text (e.g., LVMD 2490). Revise exhibit accordingly*

    d. *There are incorrect values on the Facility Sizing Tool spreadsheet. Review all sizes and revise accordingly (e.g., AVHR 0094 height and width should be should be 12' and 3' instead of 13' and 2', GTEA 0236 height should be 5', instead of 4'). Address any impacts to the MPA.*

    Response:

    a. Exhibits B and C have been provided in Appendix A for ease of identifying the proposed revisions. The exhibits show the deleted, added and revised facilities, subbasins, flow splits, flow direction and land use.

    b. The appropriate "HEC-1 model" name has been identified on the Facility Inventory Tables, F-Sheets. The 53-inch orifice opening size of the 72" RCP outlet (GTEA 0141) has also been incorporated into Inventory Table.

    c. The revised MPU Figure F-14 has been corrected to denote existing facility ID miles with blue text.

    d. Per phone call with Abigail on July 17, 2015, it was agreed that the values do not need to match because the spreadsheet for this Amendment is not used for sizing for all facilities. Instead, it is used to verify the sizes of Amendment facilities that have a P1, P2 or P3 status. Note that for these facilities, a more comprehensive analyses was provided as mentioned in the 'Notes (28)' column

of the Facility Sizing Tool spreadsheet. For these facilities, the 'Calculate Height' button is used. Should the resulting value in column 'Channel Depth/Pipe Diameter H or d (24)' be equal to or less than the proposed value, the proposed size is sufficient. No change in the proposed facility size is required. For Amendment facilities that have an E status, the sizing tool is used to verify the capacity. Should the capacity be greater or equal to the reported flow rate, the facility size is sufficient and no changes are necessary.

In reviewing all the Amendment facilities in the sizing tool, regional facility GTEA 0056 requires a future upgrade. The Amendment and design flow rate for the facility is 743 cfs and 705 cfs, respectively, while the MPU Sizing Tool identifies a capacity is 640 cfs. The results of the MPU Sizing Tool for facility GTEA 0056 indicates that the MPU freeboard criterion is not met. This updated Amendment provides facility GTEA 0057 to remove and replace facility GTEA 0056 to accommodate the MPU freeboard criterion (HLG 2-ft below bridge/culvert low cord).

12. **Comment:** *The estimated facility cost reported on the 2013 Master Plan Update included a factor of 0.773 applied to the value calculated by the Cost Tool program. For cost comparison consistency, apply the 0.773 factor to the Cost Tool values. Revise applicable tables in the report accordingly.*

    Response: Per phone call with Andrew Trelease on July 20, 2015, the 0.773 factor is applied outside of the Cost Tool. Therefore, no changes have been made to the Cost Tool. Instead, the summary tables in this Amendment have an additional column to adjust the facility cost estimates by the 0.773 factor.

13. **Comment:** *The first paragraph on Page 11 identifies ID Mile LVUP 0668, which does not exist on the MPU. Delete paragraph or clarify.*

    Response: The reported ID mile was a mistake, it should have read 'LVUP 0268'.

14. **Comment:** *Provide GIS shape files with the next submittal.*

    Response: Apologizes for the omitted GIS shape files in the previous submittal. They have been incorporated into this submittal in Appendix K.

15. **Comment:** *District requests a pre-fabricated building for the flood threat recognition monitoring station at the proposed detention basin. Contact District staff for the design plan of the building.*

    Response: The requested pre-fabricated building for the flood threat recognition monitoring station has been coordinated between Abigail M. of CCRFCD and Derick Yoro of SHG for inclusion with the Park Highlands Grand Teton Regional Flood Control Facility improvement plans.

If you have any questions or require additional information, please do not hesitate to contact us at 702-284-5300.

Respectfully Submitted,

Subject: Park Highlands West Amendment to the 2013 Las Vegas Valley Flood Control Master Plan Update

Dear Mr. Le:

This letter is submitted in response to verbal comments made on November 12, 2015 by the City of North Las Vegas (CNLV) regarding the above referenced project. Note that a meeting was held on February 2, 2016 between SHG, CNLV and Clark County Regional Flood Control District (CCRFCD) to discuss the comments. No meeting minutes were prepared; instead the response to comments have incorporated the agreed upon approach. The comments have been individually addressed as follows:

1. **Comment:** *It was previously agreed between CNLV and CCRFCD to prepare a maintenance agreement between the District and CNLV. The agreement addressed the following:*

   The MPA proposes to add existing drainage facilities within the Aliante Golf Course to the District's Master Plan Update (MPU). As discussed in previous meetings, only flood control components through the Golf Course shall be eligible for District maintenance funding. A maintenance agreement between the District and CNLV detailing maintenance funding for the flood control components must be fully developed and agreed to within six (6) months following the approval of the MPA. Address all weather access and operation and maintenance requirements of the Golf Course.

   However, per subsequent coordination between the two agencies that it was determined that the maintenance agreement is no longer required.

   Response: Per the phone conversation on November 12, 2015 with CNLV and the coordination meeting on February 2, 2016, SHG, CNLV and CCRFCD agreed that any changes in the requirement associated with the maintenance agreement will be addressed in the CNLV and/or CCRFCD's approval/adoption letter and not incorporated into the MPA report discussion.

2. **Comment:** *With the adoption of the existing drainage facilities within the Aliante Golf Course into the MPU and there being a facility requiring a future remove and replace (GTEA 0056 and GTEA 0057 at Lintwhite Street) due to a lack in freeboard below the culvert low cord, the replacement of the facility will be the responsibility of the developer.*

Response: During the February 2, 2016 meeting, it was discussed how the drainage subbasins were further divided to quantify a flow rate at the Lintwhite Street existing culvert. Specifically, Subbasin NN048-C has been divided into NN048-CW and NN048-CE to provide a flow rate at the existing culvert at Lintwhite Street instead of a concentration point located further downstream that is inclusive of area downstream of the existing culverts. The division of the subbasin helps define the area that contributes to the regional facilities, upstream and downstream of the existing culverts. The update hydrologic analyses provide a flow rate, at the existing culverts, of 570 cfs (Concentration Point CNN048CW). During the meeting, CNLV and CCRFCD showed general acceptance of the hydrologic modification. Upon agreeing on the culvert flow rates and discussing the potential acceptability of the Lintwhite Street culvert, another culvert was questioned as to the available freeboard below the culvert low cord, the existing Night Heron Way culvert (GTEA 0096). At the conclusion of the meeting, it was requested that SHG provide detailed information for each of the two culverts as to their available freeboard and the reasons for showing the culverts as 'existing' and not 'remove and replace'; CNLV and CCRFCD would then advise on whether the culverts could be identified as 'existing' or 'remove and replace'.

The requested detailed information and justification was provided to CNLV and CCRFCD on February 4, 2016. Per e-mail correspondence from CNLV on February 11, 2016 and CCRFCD on February 17, 2016, the information and justification provided was considered acceptable to show the culverts at Night Heron Way and Lintwhite Street as 'existing'. With CNLV and CCRFCD acceptance of showing the culverts as 'existing', there is no longer an obligation to the developer of PHW to replace any infrastructure within the Aliante community.

A copy of the e-mail correspondence with CNLV on February 11, 2016 and CCRFCD on February 17, 2016 have been provided in Appendix I of this Amendment. All exhibits, computations, and tables have been updated to reflect the hydrologic change and coordination with CNLV and CCRFCD.

If you have any questions or require additional information, please do not hesitate to contact us at 702-284-5300.

Respectfully Submitted,
SLATER HANIFAN GROUP

Lower Northern Las Vegas Wash Watershed Facility Sizing Tool - Version 9a

Input data in yellow columns. You may cut and paste any data.

Normal Depth:
To calculate the proposed facility height (H or d) required to convey the HEC-1 flow, press <control d> or highlight a cell in the correct line and pick the "Calculate Height" button. Not required for existing facilities.

To calculate the maximum capacity of an existing facility, press <control q> or highlight a cell in the correct line and pick the "Calculate Capacity" button. Not required for proposed facilities.

Lower Northern Las Vegas Wash Watershed Facility Sizing Tool - Version 9a

Input data in yellow columns. You may cut and paste any data.

Normal Depth:
To calculate the proposed facility height (H or d) required to convey the HEC-1 flow, press <control d> or highlight a cell in the correct line and pick the "Calculate Height" button. Not required for existing facilities.

To calculate the maximum capacity of an existing facility, press <control q> or highlight a cell in the correct line and pick the "Calculate Capacity" button. Not required for proposed facilities.

Lower Northern Las Vegas Wash Watershed Facility Sizing Tool - Version 9a

Input data in yellow columns. You may cut and paste any data.

Normal Depth:
To calculate the proposed facility height (H or d) required to convey the HEC-1 flow, press <control d> or highlight a cell in the correct line and pick the "Calculate Height" button. Not required for existing facilities.

To calculate the maximum capacity of an existing facility, press <control q> or highlight a cell in the correct line and pick the "Calculate Capacity" button. Not required for proposed facilities.

Lower Northern Las Vegas Wash Watershed Facility Sizing Tool - Version 9a

Input data in yellow columns. You may cut and paste any data.

Normal Depth:
To calculate the proposed facility height (H or d) required to convey the HEC-1 flow, press <control d> or highlight a cell in the correct line and pick the "Calculate Height" button. Not required for existing facilities.

To calculate the maximum capacity of an existing facility, press <control q> or highlight a cell in the correct line and pick the "Calculate Capacity" button. Not required for proposed facilities.

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL   LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

MASTER PLAN AMENDMENT PREPARED FOR PARK HIGHLANDS WEST MASTER PLAN COMMUNITY
REVISED CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT 2013 MASTER PLAN UPDATE
INPUT FILE DATE = FEB 2016
MODELED BY SLATER HANIFAN GROUP (KELLIN COLLINS, P.E. & CAMERON BENCINI, EI)
CHECKED BY SLATER HANIFAN GROUP (MARK FAILLA, P.E., CFM)

REFERENCED HYDROLOGIC MODELS:
UPDATE NO. 2 TO THE PARK HIGHLANDS WEST MASTER DRAINAGE STUDY
(SLATER HANIFAN GROUP, MARCH 2015)

CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT 2008 MASTER PLAN UPDATE
UPPER AND LOWER NORTHERN LAS VEGAS WASH WATERSHEDS
RECOMMENDED DRAINAGE SYSTEM WITH ULTIMATE DEVELOPMENT
INPUT FILE = CWEST3.DAT
INPUT FILE DATE = JANUARY 2016
DESIGN STORM = 100-YEAR 6-HOUR STORM
STORM DISTRIBUTION = SDN3
MODELED BY PBS&J (KRYSTLE PEMBERTON, E.I., CFM)
CHECKED BY PBS&J (HARSHAL B. DESAI, P.E., CFM)

STORM CENTERING = REMOVED DETENTION BASIN OUTFLOWS
DOWNSTREAM OF THE UPPER LAS VEGAS WASH DETENTION BASIN TO THE MOST
DOWNSTREAM POINT IN THE LOWER NORTHERN LAS VEGAS WASH WATERSHED
COMBINATION POINT DOWNSTREAM OF LOWER LAS VEGAS WASH DETENTION BASIN
WAS MODIFIED TO SIMULATE NECESSARY STORM CENTERINGS

REFERENCED HYDROLOGIC MODELS:
REVISED FINAL DESIGN REPORT FOR THE RANCHO DETENTION BASIN
PHASE II (VTN 2006)
RESPONSE TO COMMENTS ON THE CONCEPTUAL DRAINAGE STUDY FOR
NORTH LAS VEGAS 600-ACRE SITE (GC WALLACE 2006)
SECOND RESPONSE TO COMMENTS OF THE CONCEPTUAL DRAINAGE STUDY
FOR NORTH LAS VEGAS 2074-ACRE SITE (GC WALLACE 2006)
BASIN MAPS FOR SUPPLEMENT #2 TO ADDENDUM #2 TO THE MASTER
DRAINAGE STUDY FOR CLIFF'S EDGE/ PROVIDENCE (VTN 2004)
MASTER DRAINAGE STUDY FOR KYLE CANYON (GC WALLACE 2006)
TECHNICAL DRAINAGE STUDY FOR GRAND TETON DRIVE STROM DRAIN
AND AREA 1 ROADWAY IMPROVEMENTS (GC WALLACE 2006)
90% FINAL DESIGN REPORT FOR RANCHO ROAD SYSTEM - EL CAMPO
GRANDE STORM DRAIN PROJECT (PBS&J 2007)
MPA FOR RACEL STREET COLLECTOR (LOUIS BERGER JANUARY 2007)
HYDROLOGIC MODEL FOR FLOYD LAMB NORTH AND SOUTH ENVIRONMENTAL
ENHANCEMENT AREAS (LOUIS BERGER DECEMBER 7, 2007)

JR CARDS CONTAIN DARFS BASED ON THE FOLLOWING VALUES:

AREA (SQUARE MILES)	DARF
0 - 0.5	0.99
0.5 - 1	0.975
1 - 2	0.95
2 - 3	0.925
3 - 4	0.915
4 - 5	0.908
5 - 6	0.903
6 - 7	0.895
7 - 8	0.885

*** WARNING *** MODIFIED PULS ROUTING MAY BE NUMERICALLY UNSTABLE FOR OUTFLOWS BETWEEN        0. TO       52.
                THE ROUTED HYDROGRAPH SHOULD BE EXAMINED FOR OSCILLATIONS OR OUTFLOWS GREATER THAN PEAK INFLOWS.
                THIS CAN BE CORRECTED BY DECREASING THE TIME INTERVAL OR INCREASING STORAGE (USE A LONGER REACH.)
