REMARKS:

***** The Conditional Approval of this Drainage Study is to allow the engineer/developer to submit the *Improvement Plans* to City Land Development Only**

***** Do not submit the Drainage Study to Clark County Regional Flood Control District (CCRFCD) prior to the Structural Design and Calculations being approved by the City Building & Safety Department**

The Drainage Study for the subject project has been reviewed and:

	is approved subject to conformance to all City standards and the following conditions:
	must be resubmitted or supplemented including the following:
X	is conditionally approved subject to Clark County Regional Flood Control District concurrence.
	is conditionally approved subject to Clark County Public Works Department concurrence.

1. **Previous Comment**: From *Sheet 18/39* to *Sheet 21/39*, there are various proposed direct connection of lateral pipes to the 6'x6' RCB. However, the connection detail has not been provided. Provide as such in the next submittal.

   The response on *Storm Drain Construction Note #9* refers the connection detail to Sheet 33 should be revised to **Sheet 34**.

The following conditions are repeated until they are complete:

2. Drop inlets deeper than 10' require special structural design and structural calculations. Provide a soils report, structural calculations and specifications, two wet stamped structural sets, and a grading plan to the *Building Department* for processing. The engineer must provide a copy of *Building Department* approval of the structures to *Flood Control* prior to final acceptance of the *Improvement Plans*.

3. The *Master Drainage Study Update* for *Summerlin West Planning Area* proposes a modification to internal flow patterns that alters the flow patterns to the *Beltway Channel* system downstream of the *Summerlin Parkway* interchange. The modification proposes a storm drain system within *Summerlin Village 22* area (Storm Drain F) that will collect flows from the Gowan channel tributary area and route them into the *Beltway Channel* (MPU Facility APBE 0122). This resulted in increased flows in the *Beltway Channel* segment between *Summerlin Parkway* and *Far Hills Boulevard*, ie, mitigation measures are required for the impacted *Beltway Channel* segment.

   A technical drainage study for the modification of the Beltway Channel has been submitted and has just been conditionally approved. The subject drainage study will not be approved prior to the construction bond of the *Beltway Channel Modification* project has been executed.

4. The site is adjacent to or crosses an existing or proposed *Clark County Regional Flood Control District* (CCRFCD) master planned facility. Therefore, CCRFCD concurrence is required prior to final approval of the drainage study.

   Please note that effective March 15, 2019, the CCRFCD adopted new requirements for drainage study concurrence submittal. Follow the link below for specific guidance.

   http://gustfront.ccrfcd.org/LandDev/LandDev.aspx

5. The project proposes to build temporary drainage facilities, ie, berms/swales along the west side of *Scurry Bend Drive* and *Kettle Ridge Drive* and at the southern end of *Kettle Ridge Drive* for interim flood protection. Prior to final plan approval the developer must complete a maintenance and liability agreement for the interim drainage improvements (berms or channels) and post a minimum maintenance bond of $50,000 or 50-percent of the construction cost for the improvements, whichever is greater. The engineer must submit an estimate of the quantities for constructing the facility and an exhibit that adequately shows the location and limits of the drainage facility to *City of Las Vegas Flood Control* for approval. Once the drainage study is conditionally approved, the engineer should contact the *City's Land Development Section* (229-6371) to begin the agreement process.

   In order for the maintenance bond to be released in the future, a drainage update / letter will be required to justify that the offsite berms / channels are no longer necessary and can be removed.

6. The drainage study and the subject improvement plans also proposed a debris basin along the west side of the *Western Beltway*. Acknowledge in the next submittal that the debris basin is a temporary facility and will be removed in the ultimate condition.

   Since the debris basin is an interim facility, *Summerlin* or *Howard Hughes Company* will be solely responsible for the maintenance of the facility. A construction and maintenance bond for the debris basin must be prepared and executed prior to the approval of the improvement plans.

7. The regional facility in *Kettle Ridge Drive* will be a public facility and will be maintained by the City. The improvement plans must be reviewed for maintenance and access concerns by *City Streets & Sanitation Department* for their review and approval which must be secured prior to the subject drainage study approval. Contact *Mr. Matthew Meyer, Streets & Sanitation Manager* for guidance.

In an effort to increase administrative efficiency, for all original and re-submittal packages including updates and the addenda, the City of Las Vegas Public Works Department requires both a hardcopy and a digital copy (PDF) on CD for the drainage study.

A letter sealed and signed by a Nevada registered civil engineer must be included in every submittal certifying documents on the electronic CD matches 100% of the hardcopy submittal. The new submittal requirement is effective on May 1, 2019. If there are any questions regarding these new requirements, please contact Albert Sung in the City Flood Control Section at (702) 229-6541.

Sample Letter to certify CD.pdf

NOTE: Please be advised that all land surface area disturbances over 1 acre or any area adjacent to a water way must submit to the *Nevada Division of Environmental Protection* a "Notice of Intent" to discharge that certifies a stormwater pollution prevention plan has been developed and is maintained on site; for inclusion in the Stormwater General Permit No. NVR100000. A phased construction unit in a contiguous subdivision is considered under construction until all stripped or disturbed surface areas have been covered by paving, building construction or planting. For more information, including forms and applications see http://ndep.nv.gov/bwpc/storm01.htm or call (775) 687-9429.

This supplement focuses on requirements specific to the City of Las Vegas. The requirements presented are in addition to the Clark County Regional Flood Control District (CCRFCD) Manual Standard Form 2. The listed items are the minimum information required prior to the City performing a review. The engineer will remain responsible to ensure the Technical Drainage Study is prepared within the guidelines as set forth in the CCRFCD Hydrologic Criteria and Drainage Design Manual (Design Manual).

An appointment must be made to preview this checklist in conjunction with CCRFCD Standard Form 2 prior to the City accepting a new drainage study for review. The engineer must contact the Flood Control Section at (702) 229-6541 to schedule a submittal appointment.

If items are not applicable for the subject site, provide N/A.

RE: ADDENDUM #1 TECHNICAL DRAINAGE STUDY FOR SUMMERLIN WEST VILLAGE 22
KETTLE RIDGE DRIVE (STREET J): FLEET WING AVENUE (STREET G) TO LAKE MEAD BOULEVARD & SCURRY BEND DRIVE (STREET N) ROUGH GRADE: FLEET WING AVENUE (STREET G) TO LAKE MEAD BOULEVARD

Dear Albert,

This letter and the attached documents have been prepared as an Addendum #1 to the *Technical Drainage Study (TDS) for Summerlin West Village 22 Kettle Ridge Drive (Street J) Fleet Wing Avenue (Street G) to Lake Mead Boulevard & Scurry Bend Drive (Street N) Rough Grade: Fleet Wing Avenue (Street G) to Lake Mead Boulevard*.

Comment #1: *The Master Drainage Study Update for Summerlin West Planning Area* proposes a modification to internal flow patterns that alters the flow patterns to the *Beltway Channel* system downstream of the *Summerlin Parkway* interchange. The modification proposes a storm drain system within *Summerlin Village 22* area (Storm Drain F) that will collect flows from the Gowan channel tributary area and route them into the *Beltway Channel* (MPU Facility APBE 0122). This resulted in increased flows in the *Beltway Channel* segment between *Summerlin Parkway* and *Far Hills Boulevard*, ie, mitigation measures are required for the impacted *Beltway Channel* segment.

A technical drainage study for the modification of the Beltway Channel has been submitted and has just been conditionally approved. The subject drainage study will not be approved prior to the construction bond of the *Beltway Channel Modification* project has been executed.

Comment response: The developer, The Howard Hughes Corporation, has acknowledged that a construction bond for the Beltway Channel Modification Project, will be in place for approval of this Technical Drainage Study. However, it is expected that this comment is not to hold up a conditional approval of the TDS.

Comment #2: The site is adjacent to or crosses an existing or proposed *Clark County Regional Flood Control District* (CCRFCD) master planned facility. Therefore, CCRFCD concurrence is required prior to final approval of the drainage study.

Please note that effective March 15, 2019, the CCRFCD adopted new requirements for drainage study concurrence submittal. Follow the link below for specific guidance.

http://gustfront.ccrfcd.org/LandDev/LandDev.aspx

Comment response: The proposed report will be submitted to CCRFCD for concurrence.

Comment #3: The project proposes to build temporary drainage facilities, ie, berms/swales along the west side of *Scurry Bend Drive* and *Kettle Ridge Drive* for interim flood protection. Prior to final plan approval the developer must complete a maintenance and liability agreement for the interim drainage improvements (berms or channels) and post a minimum maintenance bond of $50,000 or 50-percent of the construction cost for the improvements, whichever is greater. The engineer must submit an estimate of the quantities for constructing the facility and an exhibit that adequately shows the location and limits of the drainage facility to *City of Las Vegas Flood Control* for approval. Once the drainage study is conditionally approved, the engineer should contact the City's *Land Development Section* (229-6371) to begin the agreement process.

In order for the maintenance bond to be released in the future, a drainage update / letter will be required to justify that the offsite berms / channels are no longer necessary and can be removed.

Comment response: It is acknowledged that Atkins will contact the City's Land Development Section to begin the agreement process for the interim drainage improvements upon conditional approval of this study.

Comment #4: The drainage study and the subject improvements plans also proposed a debris basin along the west side of the *Western Beltway*. Acknowledge in the next submittal that the debris basin is a temporary facility and will be removed in the ultimate condition.

Since the debris basin is an interim facility, *Summerlin* or *Howard Hughes Company* will be solely responsible for the maintenance of the facility. A construction and maintenance bond for the debris basin must be prepared and executed prior to the approval of the improvement plans.

Comment response: It is acknowledged that Howard Hughes HOA will be responsible for maintenance of the debris basin and that a construction and maintenance bond will be in place prior to the approval of the TDS.

Comment #5: The regional facility in *Kettle Ridge Drive* will be a public facility and will be maintained by the City. The improvement plans must be reviewed for maintenance and access concerns by *City Streets & Sanitation Department* for their review and approval which must be secured prior to the subject drainage study approval. Contact *Mr. Matthew Meyer, Streets & Sanitation* for guidance.

Comment response: Atkins has realigned the regional storm drain per meeting with the City. It is acknowledged that Atkins will send plans to Mr. Meyer of Streets & Sanitation for his approval before final approval of the TDS. However, it is expected that this comment is not to hold up a conditional approval of the TDS.

Comment #6: A cursory review of the WSPGW output file for the storm drain in *Kettle Ridge Drive* <Street J (SJ)> showed that the velocity can reach beyond 300 ft/s. This appears to be some error in the model. Review and revise in the next submittal.

Comment response: The error in the model has been fixed and there are no longer excessive velocities in the WSPGW modeling.

Comment #7: The proposed 54"-RCP to 10'x6'-RCB storm drain system in *Kettle Ridge Drive* appears to be too close to the street curb & gutter. In case of repair or maintenance in the future, the curb & gutter will likely be disturbed for open trench or staging area for the repair. Relocate the 54"0RCP to 10'x6'-RCB system towards the center of *Kettle Ridge Drive* as much as possible.

Comment response: The storm drain system has been revised further from the curb & gutter.

Comment #8: It is noticed that besides storm drain and water lines are shown in the improvement plans, no sanitary sewer is shown. Is this an omission or no sanitary sewer is planned at all? *Kettle Ridge Drive*, a proposed 41'-ROW street is simply too narrow to contain various utilities and to satisfy all the minimum

clearances criteria. The developer may need to widen *Kettle Ridge Drive* roadway or choose another street to accommodate the 10'x6'-RCB regional facility. The layout of utilities as presented is simply unacceptable. This must be addressed and resolved prior to the next drainage study submittal.

Comment response: Utilities in Kettle Ridge Drive have been revised as discussed in the meeting with the City. For reference, sanitary sewer will only cross Kettle Ridge Drive at Kestrel Creek Avenue (Street I). It is not in parallel with the other utilities.

Comment #9: Storm Drain Manholes SDMH#2, SDMH#4, and SDMH#9 appears to be specially designed structures to combine a manhole with a drop inlet which the City has not tested before. By relocating the storm drain system away from the curb towards the street center, this special structure shall then be eliminated.

Comment response: The storm drain has been revised towards the street center and the special structure has been eliminated.

Comment #10: Drop inlets deeper than 10' require special structural design and structural calculations. Provide a soils report, structural calculations and specifications, two wet stamped structural sets, and a grading plan to the *Building Department* for processing. The engineer must provide a copy of *Building Department* approval of the structures to *Flood Control* prior to the final acceptance of the drainage study.

Comment response: Structural calculations are being submitted to the Building Department.

Comment #11: Sheet 29/37: *Section Detail A* must show the riprap size information in the swale adjacent to the rough graded *Scurry Bend Drive* as proposed in the drainage study.

Comment response: The riprap sizing information has been added to the plans.

Comment #12: The proposed 54"-RCP to 10'x6'-RCB in *Kettle Ridge Drive* is a regional facility. Label with the *Clark County Regional Flood Control District's* facility ID on the plan.

Comment response: The storm drain has been labeled accordingly.

Comment #13: Revise all drop inlets to Type "C-D" Modified Drop Inlet per Standard Drawing 412.1 or Neenah Pre-cast inlets. Note that the lengths of "C-D" modified inlets are in the multiple of 2.5'. Revise all pertinent construction notes and callouts accordingly.

Comment response: The drop inlets, construction notes, and callouts have been revised.

Comment #14: Add a note in all pertinent sheets for the construction of all storm drain drop inlets per a newly adopted USDCCA Drawing No. 421 (Stormwater Quality Management Stamp and Sign Detail).

Comment response: The note has been added to the relevant sheets.

THIS PROPERTY MAY HAVE STATIC WATER PRESSURE IN EXCESS OF 80 PSI. THE UNIFORM PLUMBING CODE REQUIRES THAT INDIVIDUAL, ON-SITE (PRIVATE) PRESSURE REDUCING VALVES BE INSTALLED WHENEVER THE PRESSURE EXCEEDS 80 PSI. PRV'S ARE THE DEVELOPER'S RESPONSIBILITY AND WILL NOTE BE INSPECTED OR INCLUDED IN THE ACCEPTANCE OF THE LAS VEGAS VALLEY WATER DISTRICT FACILITIES.

NOTICE OF INTENT NOTE

NOTE: ALL LAND SURFACE AREA DISTURBANCES OVER 1 ACRE REQUIRE A STORMWATER DISCHARGE PERMIT ISSUED BY THE NEVADA DIVISION OF ENVIRONMENTAL PROTECTION (NDEP). A PHASED CONSTRUCTION UNIT IN A CONTIGUOUS SUBDIVISION IS CONSIDERED UNDER CONSTRUCTION UNTIL ALL STRIPPED SURFACE AREAS HAVE BEEN COVERED BY PAVING, BUILDING CONSTRUCTION OR PLANTING. A STORMWATER DISCHARGE PERMIT APPLICATION AND ASSOCIATED INFORMATION MAY BE DOWNLOADED FROM THE WEB SITE: HTTP://WWW.STATE.NV.US/BWPC/STORM01.HTM PROJECTS THAT DISTURB MORE THAN ONE ACRE OF LAND MUST SUBMIT TO NDEP A "NOTICE OF INTENT" FOR INCLUSION UNDER STORMWATER PERMIT NO. NVR100000 ALONG WITH APPROPRIATE FILLING FEE.

NPDES PERMIT NOTE

THE ENGINEER SHOULD CONTACT THE NEVADA DIVISION OF ENVIRONMENTAL PROTECTION (NDEP) TO OBTAIN A NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT PRIOR TO CONSTRUCTION. ALL CONSTRUCTION PROJECTS ONE ACRE OR LARGER MUST APPLY FOR THE PERMIT THROUGH NDEP. ALL QUESTIONS REGARDING THE NPDES PERMIT REQUIREMENTS SHOULD BE DIRECTED TO THE NDEP AT (775) 687-9429.

MINIMUM DRAINAGE STUDY CRITERIA
STANDARD FORM 2 CHECKLIST SUPPLEMENT

(Revised 5/18/11)

The following checklist is intended as a supplemental guide for the engineer preparing a Technical Drainage Study submittal to the City of Las Vegas. This supplement focuses on requirements specific to the City of Las Vegas. The requirements presented are in addition to the Clark County Regional Flood Control District (CCRFCD) Manual Standard Form 2. The listed items are the minimum information required prior to the City performing a review. The engineer will remain responsible to ensure the Technical Drainage Study is prepared within the guidelines as set forth in the CCRFCD Hydrologic Criteria and Drainage Design Manual (Design Manual).

An appointment must be made to preview this checklist in conjunction with CCRFCD Standard Form 2 prior to the City accepting a new drainage study for review. The engineer must contact the Flood Control Section at (702) 229-6541 to schedule a submittal appointment.

If items are not applicable for the subject site, provide N/A.

I. GENERAL REQUIREMENT		
Yes	No	
	N/A	A notarized letter from the adjacent property owner(s) allowing off-site grading. (A copy of the letter must be received prior to final acceptance of the drainage study.)
x		Copies of all conditions of approval for development related to this property. (e.g. zoning, use permit, tentative map, etc.) Verify compliance with conditions.
X		An electronic copy of the complete submittal is required to be submitted with one original hard copy of the study. Electronic documents should be on a universal computer-readable digital output device replicating your submittal. An Indexed Portable Document Format (PDF) or Print Ready CAD file formats with a minimum of 300dpi are the desired formats. If figures are in color, they must be scanned in color and saved as a separate file. MMA by initial here, the engineer on record acknowledges that the electronic copy is an identical replicate of the original hard copy submitted to the City of Las Vegas.

II. GRADING PLAN INFORMATION		
Yes	No	
X		(1) 24" X 36" copy of the Grading Plan, (including all Detail Sheets) sealed by the engineer.
X		Proposed future and existing spot grades for top of curbs and street crowns at lot lines, grade breaks, and along curb returns on both sides of the street. Note: Proposed top of curb elevations must be provided for both sides of roadways even if only half street construction is required.
X		Label existing topography at a minimum 5 foot elevation interval including adjacent developments, finished floor elevations of existing buildings and top of existing curbs extending 100 feet* around the perimeter of the site. (*Measured from the centerline of the adjacent roadway.)

RE: ADDENDUM #2 TECHNICAL DRAINAGE STUDY FOR SUMMERLIN WEST VILLAGE 22 KETTLE RIDGE DRIVE (STREET J): FLEET WING AVENUE (STREET G) TO LAKE MEAD BOULEVARD & SCURRY BEND DRIVE (STREET N) ROUGH GRADE: FLEET WING AVENUE (STREET G) TO LAKE MEAD BOULEVARD

Dear Albert,

This letter and the attached documents have been prepared as an Addendum #2 to the *Technical Drainage Study (TDS) for Summerlin West Village 22 Kettle Ridge Drive (Street J) Fleet Wing Avenue (Street G) to Lake Mead Boulevard & Scurry Bend Drive (Street N) Rough Grade: Fleet Wing Avenue (Street G) to Lake Mead Boulevard*.

Comment #1: Drop inlets deeper than 10' require special structural design and structural calculations. Provide a soils report, structural calculations and specifications, two wet stamped structural sets, and a grading plan to the *Building Department* for processing. The engineer must provide a copy of *Building Department* approval of the structures to *Flood Control* prior to the final acceptance of the drainage study.

Comment response: Structural details have been provided in this submittal for the deep drop inlets. Per coordination with Luis Morales of CLV Land Development, structural review will be concurrent with the Civil Improvement Plans. Atkins will provide approval letter of structural design to CLV Flood Control for final acceptance of drainage study.

Comment #2: From the *Sheet 18/39* to *Sheet 21/39*, there are various proposed direct connection of lateral pipes to the 6'x6' RCB. However, the connection detail has not been provided. Provide as such in the next submittal.

Comment response: Connection details have been provided in this submittal.

The following conditions are repeated until they are complete:

Comment #3: The *Master Drainage Study Update* for *Summerlin West Planning Area* proposes a modification to internal flow patterns that alters the flow patterns to the *Beltway Channel* system downstream of the *Summerlin Parkway* interchange. The modification proposes a storm drain system within *Summerlin Village 22* area (Storm Drain F) that will collect flows from the Gowan channel tributary area and route them into the *Beltway Channel* (MPU Facility APBE 0122). This resulted in increased flows in the *Beltway Channel* segment between *Summerlin Parkway* and *Far Hills Boulevard*, i.e., mitigation measures are required for the impacted *Beltway Channel* segment.

A technical drainage study for the modification of the Beltway Channel has been submitted and has just been conditionally approved. The subject drainage study will not be approved prior to the construction bond of the *Beltway Channel Modification* project has been executed.

Comment response: The construction bond of the Beltway Channel Modification project has been executed. See receipt provided by VTN Nevada in Appendix B.

Comment #4: The site is adjacent to or crosses an existing or proposed *Clark County Regional Flood Control District* (CCRFCD) master planned facility. Therefore, CCRFCD concurrence is required prior to final approval of the drainage study.

Please note that effective March 15, 2019, the CCRFCD adopted new requirements for drainage study concurrence submittal. Follow the link below for specific guidance.

http://gustfront.ccrfcd.org/LandDev/LandDev.aspx

Comment response: This report will be submitted to CCRFCD for concurrence.

Comment #5: The project proposes to build temporary drainage facilities, i.e., berms/swales along the west side of *Scurry Bend Drive* and *Kettle Ridge Drive* and at the southern end of *Kettle Ridge Drive* for interim flood protection. Prior to final plan approval the developer must complete a maintenance and liability agreement for the interim drainage improvements (berms or channels) and post minimum maintenance bond of $50,000 or 50-percent of the construction cost for the improvements, whichever is greater. The engineer must submit an estimate of the quantities for constructing the facility and an exhibit that adequately shows the location and limits of the drainage facility to *City of Las Vegas Flood Control* for approval. Once the drainage study is conditionally approved, the engineer should contact the *City's Land Development Section* (229-6371) to begin the agreement process.

In order for the maintenance bond to be released in the future, a drainage update / letter will be required to justify that the offsite berms / channels are no longer necessary and can be removed.

Comment response: Once this drainage study is conditionally approved, the report will be submitted to the Land Development section to begin the agreement process.

Comment #6: The drainage study and the subject improvement plans also proposed a debris basin along the west side of the *Western Beltway.* Acknowledge in the next submittal that the debris basin is a temporary facility and will be removed in the ultimate condition.

Since the debris basin is an interim facility, *Summerlin* or *Howard Hughes Company* will be solely responsible for the maintenance of the facility. A construction and maintenance bond for the debris basin must be prepared and executed prior to the approval of the improvement plans.

Comment response: A construction and maintenance bond for the debris basin will be executed prior to the approval of the improvement plans.

Comment #7: The regional facility in *Kettle Ridge Drive* will be a public facility and will be maintained by the City. The improvement plans must be reviewed for maintenance and access concerns by *City Street & Sanitation Department* for their review and approval which must be secured prior to the subject drainage study approval. Contact *Mr. Matthew Meyer, Streets & Sanitation Manager* for guidance.

Comment response: The improvement plans were submitted to Mr. Meyer of the City Street & Sanitation Department on October 3, 2019.

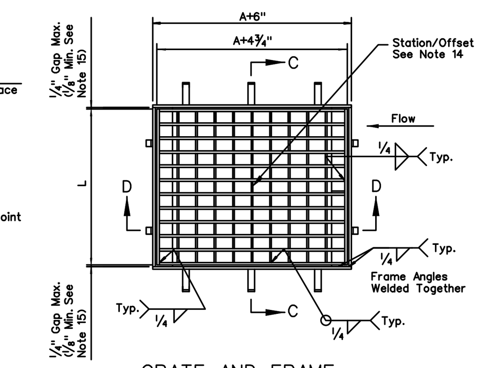
SECTION A-A



GRATE AND FRAME

NOTES:

1. All concrete shall be class A or AA.
2. Reinforcing steel shall be No.4 bars with maximum spacing at 18 inch centers, wired tightly at all intersections and embedded 2 inches clear of all concrete surfaces.
3. Exposed edges of concrete shall be chamfered 1 inch.
4. Dimensions may be varied to fit local conditions if ordered by the engineer.
5. Commercial prefabricated gratings approved by the bridge division may be used in lieu of the field-welded grating shown.
6. Extreme low cover situations to be reviewed by hydraulics engineer.
7. Slope catch basin floors 10:1 from all directions toward outlet pipe. If basin is used as a junction, shape flow line(s) to outlet pipe and provide a 10:1 slpoe to flow line(s).
8. See sheet R-2.9.1 for details if connecting HDPE pipe.
9. A single Type 2 drop inlet shall be constructed unless a double or triple is specified.
10. Single grate configuration shown for clarity. Outside dimensions of each grate shall measure 2 feet by A+4¾".
11. Run rebar continuous thru construction joint. Joint must be a minimum of 3 inches from horizontal bars.
12. Weld one tab on ℄ of grate and remaining two tabs 6 inches from edge of frame. Six tabs per inlet, three tabs on each side
13. Weld tabs 6 inches from edge of frame. Four tabs per grate, two on each side.
14. For multiple grate installations, the station/offset is to the center of the concrete drop inlet structure.
15. Grate is to fit in the frame and be easily removed. If the gap between the grate and frame is greater than ¼" on each side of the grate, the grate and frame shall be removed and reconstructed to the tolerances specified or, with approval of the engineer, a filler strip up to ¼" in thickness may be welded flush to the top of the frame to reduce the gap to a maximum of ¼"
16. Additional pipe penetrations may be placed in any wall. Pipe penetrations are to be to the center of the structure wall unless specified otherwise.

MINIMUM DRAINAGE STUDY CRITERIA
STANDARD FORM 2 CHECKLIST SUPPLEMENT

(Revised 5/18/11)

The following checklist is intended as a supplemental guide for the engineer preparing a Technical Drainage Study submittal to the City of Las Vegas. This supplement focuses on requirements specific to the City of Las Vegas. The requirements presented are in addition to the Clark County Regional Flood Control District (CCRFCD) Manual Standard Form 2. The listed items are the minimum information required prior to the City performing a review. The engineer will remain responsible to ensure the Technical Drainage Study is prepared within the guidelines as set forth in the CCRFCD Hydrologic Criteria and Drainage Design Manual (Design Manual).

An appointment must be made to preview this checklist in conjunction with CCRFCD Standard Form 2 prior to the City accepting a new drainage study for review. The engineer must contact the Flood Control Section at (702) 229-6541 to schedule a submittal appointment.

If items are not applicable for the subject site, provide N/A.

I. GENERAL REQUIREMENT		
Yes	No	
	N/A	A notarized letter from the adjacent property owner(s) allowing off-site grading. (A copy of the letter must be received prior to final acceptance of the drainage study.)
X		Copies of all conditions of approval for development related to this property. (e.g. zoning, use permit, tentative map, etc.) Verify compliance with conditions.
X		An electronic copy of the complete submittal is required to be submitted with one original hard copy of the study. Electronic documents should be on a universal computer-readable digital output device replicating your submittal. An Indexed Portable Document Format (PDF) or Print Ready CAD file formats with a minimum of 300dpi are the desired formats. If figures are in color, they must be scanned in color and saved as a separate file. MMA by initial here, the engineer on record acknowledges that the electronic copy is an identical replicate of the original hard copy submitted to the City of Las Vegas.

II. GRADING PLAN INFORMATION		
Yes	No	
X	(702) 551-0330	(1) 24" X 36" copy of the Grading Plan, (including all Detail Sheets) sealed by the engineer.
X		Proposed future and existing spot grades for top of curbs and street crowns at lot lines, grade breaks, and along curb returns on both sides of the street. Note: Proposed top of curb elevations must be provided for both sides of roadways even if only half street construction is required.
X		Label existing topography at a minimum 5 foot elevation interval including adjacent developments, finished floor elevations of existing buildings and top of existing curbs extending 100 feet* around the perimeter of the site. (*Measured from the centerline of the adjacent roadway.)

II. GRADING PLAN INFORMATION		
Yes	No	
X		Proposed on-site and off-site storm drains and other flood control facilities with plan and profile sheets for public storm drains showing the class of pipe, (Class III, IV, V, etc.), design hydraulic grade line, (HGL) and 100 year storm flow. A public drainage easement must be provided over on-site storm drains conveying off-site flows. An overflow path must be provided over all storm drains.
X		All existing and "to be constructed" walls with cross-sections showing wall type, (e.g. block wall, retaining wall, flood wall, etc.), with limits clearly defined, adjacent ground elevations. Wall heights must meet current ordinances and in no case exceed 14 feet above the adjacent property.
X		Street slopes for both interior and perimeter streets. Note: The minimum slope for a roadway is 0.4 percent, a minimum 18-inch storm drain must be provided where minimum slopes cannot be met.
	N/A	Back of lot elevations and lot drainage pattern for all lots including common lots.
X	X	Sites with a grade difference two feet above or below existing ground are required to have approval from City of Las Vegas Current Planning. Current Planning approval is required prior to final approval of the drainage study.
X		On-site facilities must perpetuate flows through or around the site without significantly impacting adjacent property owners. (The project must pass flows through the site every 600 feet where the project is blocking flow paths.)
X		This project uses a solid grouted stem wall (or approved alternate) at the back of sidewalk to provide erosion protection for landscaped areas where the depth of flow in the roadway exceeds the back of walk elevation. A corresponding cross-section detail is included.
X		Commercial and Common Lot Landscape areas are not allowed to drain over the sidewalk. The grading plans show flow lines with grades and sidewalk under drains for all landscape areas draining to the public ROW.

III. Local Entity Criteria - City of Las Vegas – Manual Section 1600

	N/A	Concrete valley gutters are required in parking lots with slopes less than 1 percent. Slopes through cul-de-sac must be at a 1 percent minimum where flow is drained through the cul-de-sac.
X		Ten-foot wide public drainage easements to be privately maintained are allowed for flow less than 20 cfs. The depth of flow entering the easement must be checked using the submerged weir calculation.
X		The limits of the flood zones and the base flood elevations (BFE) must be shown on all grading plans for all developments within a Special Flood Hazard Zone A, AO, AE, etc.
	N/A	Minimum finish floor elevation is 6 inches above highest adjacent top of curb. Finish floor calculations must include allowances for super elevations on curves and velocity head for tee intersections.
	N/A	Finished floor elevations for buildings adjacent to public drainage easements must be a minimum of 18 inches above the Q100 weir of submerged weir elevation, whichever is greater.

III. Local Entity Criteria - City of Las Vegas – Manual Section 1600		
Yes	No	
	N/A	Lots with “B and C Type Drainage” that drain from one lot to another through a drainage easement shall be required to install an underground nuisance drainage system or a 2-foot valley gutter. 16” x 24” minimum block wall openings are required for both options.
	N/A	Bubblers are required across 80 foot and greater ROW streets. When flows exceed 10 cfs, bubblers larger than 18 inches will be required up to a maximum of 36”. Inlets must be sized to match the pipe size provided.

- Contact the Flood Control Section regarding the drainage study review fee. These fees are payable at the time of submittal.
- The Drainage Study must be conditionally approved prior to submitting improvement plans to the Civil and Planning Development of the Department of Building and Safety for review.

This document is intended as an **aid** in preparing Technical Drainage Studies for the City of Las Vegas. Each study submitted is reviewed for compliance with local and regional criteria. This form is not intended to be all-inclusive and does not limit the extent of the information, calculations or exhibits which may be necessary to properly evaluate the intended land use.

Executive Summary

This Technical Drainage Study (TDS), prepared on behalf of Howard Hughes Company, LLC represents the hydrologic and hydraulic analysis for the Kettle Ridge Drive (Street J) roadway improvements of the Summerlin West Village 22 development, as well as the Scurry Bend Drive (Street N) rough grade improvements. Summerlin West Village 22 is located in the northwest Las Vegas Valley west of the CC-215 beltway and is bounded by Lake Mead Boulevard and Summerlin Parkway. A vicinity map is provided in Figure 1. The Kettle Ridge Drive development and Scurry Bend Drive rough grade are located between Fleet Wing Avenue (Street G) and Lake Mead Boulevard and are shown on the location map on Figure 2.

A Master Conceptual Drainage Study (MCDS) for Summerlin West Village 22 (W.O. 7861-3A) was approved November 28, 2018. Addendum #2 to Update #1 of the MCDS was approved May 29, 2019. Portions of the TDS, such as parcel names, rainfall depths, and facility locations are directly referenced from the MCDS and the relevant information is included in Appendix A.

1. Hydrologic Analysis

1.1. Existing Condition

The existing site condition is undeveloped desert land. As established in the Master Conceptual Drainage Study (MCDS), there is one existing downstream storm drain facility that collects runoff from the proposed street improvements and adjacent development. The Western Beltway Channel to the east of the project is fully developed and includes a 20-foot wide concrete channel that conveys flow north to the Village 26 Detention Basin.

In the existing condition, runoff generated by the project and the undeveloped areas west of the project drains east as sheet flow to the Western Beltway Channel. According to the 2002 Conceptual Drainage Study and Western Beltway Study, the existing channel has been designed to accept both the existing and ultimate condition flows from Village 22. The Village 22 site was included in the area previously analyzed in the Western Beltway Study. In addition, the allowable discharge flow rates for the project have been established in the 2017 Summerlin West Planning Area (SWPA) MPU study. Therefore, an additional existing condition hydrologic model was not required as part of this study.

1.2. Interim Condition

The proposed roadway is referred to as “Kettle Ridge Drive” in this study and on the plans. The MCDS refers to the proposed roadway by a letter name, “Street J”. Now that the roadways have been named, the plans and report refer to the roadways by name. Table 6 in Section 2.6 compares the roadway names to their letter name in the MCDS.

The proposed Kettle Ridge Drive improvements will be constructed prior to the adjacent onsite parcels and roadways. As a result, an interim condition exists for the proposed improvements. Refer to Figure 3 for the interim condition hydrology workmap.

The proposed street improvements and interim grading have been designed to ensure that the existing drainage patterns are maintained in the interim condition and none of the existing downstream facilities are adversely affected by the proposed improvements.

The berm at Scurry Bend Drive will cut off upstream offsite flow for Parcels E, F, and Kettle Ridge Drive in the interim condition. The flow discharges within the proposed and existing ditch to the east to the existing Western Beltway Channel. The proposed berm and storm drain in Kettle Ridge Drive will cut off upstream offsite flow for Parcels G, H, J, and K. The Kettle Ridge Drive storm drain flows south and will discharge to the diversion ditch for the Scurry Bend Drive flow.

The interim subbasins were modeled using HEC-1. The results are summarized in Table 1 and on Figure 3.

2.1. Drop Inlet Calculations

The computer program Bentley FlowMaster was utilized to perform calculations for the nine proposed drop inlets along Street J. SDDI #2, SDDI #3, and SDDI #5 correspond to drop inlets in the proposed ditch west of the roadway. The remaining drop inlets capture the flow along the proposed roadway. Drop inlet calculations are provided in Appendix C.1. Table 3 provides a summary of the drop inlets. Drop inlet locations and calculation summaries are shown on Figure 4.

2.2. Normal Depth Calculations

The computer program Bentley FlowMaster V8i was utilized to perform normal depth calculations for the proposed roadway. These normal depth calculations were utilized to ensure that the proposed storm drain facility is adequately designed and that all local street flow criteria is met.

Six cross-sections were analyzed. The cross-section locations were specified based on the flow patterns and utilized the worst-case slope or roadway width when applicable for the calculations.

Table 4 summarizes the normal depth calculations for the 100-year storm event. Depth*Velocity must be less than 8 for the 100-year and less than 6 for the 10-year. The 100-year D*V for all street cross-sections is less than 6. Therefore, the10-year D*V is also less than 6. To minimize redundancy, the 10-year calculations are not included. Print-outs of all normal depth calculations for the ultimate condition are provided in Appendix C.2. Cross section locations and calculation summaries are shown on Figure 4.

2.3. Storm Drain System Modeling

The proposed storm drain systems were modeled using Water Surface Pressure Gradient (WSPG-W). A print-out of the WSPG-W models are provided in Appendix C.3 and Appendix C.4. Because the interim condition flows are higher than the ultimate condition flows in some areas, both conditions were analyzed in the WSPG-W models. The Q_{100} and hydraulic grade lines for both conditions are shown on the improvement plans in Appendix D. Table 5 summarizes the WSPG-W model at the mainline manholes.

2.4. HEC-RAS 2D Modeling

Atkins was tasked with performing detailed hydraulic modeling to review options for potential drainage channel improvements for Village 27. A 2-dimensional (2D) hydraulic model of the washes was used to establish the existing hydraulic condition and to analyze several potential options to divert flow away from the proposed development parcels. Portions of this 2D model were referenced in the approved Overall Summerlin West Planning Area (SWPA) MCDS.

Several of the washes analyzed in this model are upstream of Village 22 and were analyzed in further detail for this Technical Drainage Study (TDS).

The US Army Corps of Engineers HEC-RAS v. 5.0.7 program was used for the two-dimensional (2D) hydraulic model for this project. This program can run both 1-dimensional (1D) and 2D hydraulic calculations for a full network of natural and constructed channels. For the purposes of this project, only the 2D interface was used.

LiDAR collected by the Southern Nevada Water Authority (SNWA) in 2016 was used as the source for digital elevation data. The model was developed using a 20-ft maximum element size. Hydrographs from the offsite hydrology served as the inflow boundary conditions for the model. HEC-1 output for the 2D model for subbasin INT-N is located in Appendix B.2. A uniform Manning's roughness of 0.036 was used for the entire project area. The model simulations were run for 18 hours with a 1-second timestep.

The Scurry Bend Drive (Street N) rough grading contours were merged with the existing condition topography to analyze the berm and ditch required to divert the flow around the proposed project area. Figure 5 and Figure 6 represent the depth of flow and the velocity, respectively in the 2D model.

2.5. Riprap Calculations

The riprap calculations were performed utilizing shear stress calculations based on HCDDM Section 705 using HEC-11 methodology. Shear stress calculations show that a median riprap particle size (D_{50}) for the ditch along Kettle Ridge Drive of 8 inches is required to resist the average channel shear stress for the channel velocities along the ditch. Results are shown in Appendix C.5.

Riprap erosion control measures also were analyzed downstream of the proposed 10'x6' RCB that outlets into the channel carrying the flow diverted from upstream of Scurry Bend Drive. Conservative calculations using no tailwater elevation at the 10'x6' RCB outlet were used to determine the maximum velocity of 8.08 ft/s generated from a 100-year storm event, resulting in a D_{50} riprap size of 8 inches.

2.6. Debris Basin Calculations

A temporary debris basin is needed in Village 22 to detain sediment runoff from the adjacent foothills and the proposed roadway. The Modified Universal Soil Loss Equation was used in order to determine the sediment yield based on short-term, high-intensity storm events. The calculated parameters of this equation are described in detail and the final calculations are shown in Appendix C.6.

Soil Erodibility Factor, K=0.36
This factor is based on the function of percent of silt, percent of coarse sand, soil structure, permeability of soil and percent of organic matter. A conservative K value was determined by taking the weighted average of the K Factor (Rock Free) per USDA Web Soil Survey Map (shown in Appendix C.6).

Topographic Factor, LS=8.14
This factor is based on the field runoff length (Xr) and surface slope (So). Xr is based on the longest flow path to the proposed debris basin. The flowline begins at the top of subbasin "INT-LMB1" and flows east to Street J. Flow continues south along Street J before turning east towards the proposed debris basin. Xr = 10,547 ft & So= 0.0683 (ft/ft).

Cropping-Management Factor, C=0.45
This factor is based as the ratio of soil loss from land cropped under specific conditions to corresponding loss from tilled, continuously fallow ground.
C1 is the effect of canopy cover (Fig 1303b). The tributary area to the proposed debris basin does not have any canopy effect, thus C1=1.0
C2 is the effect of mulch or close-growing vegetation (Fig 1303c). The tributary area to the proposed debris basin does not have any canopy effect, thus C2=1.0
C3 is the effect of tillage and residual land use. The tributary area is roughly 20% covered in weeds, thus C3=0.45

Conservation Practice Factor, P=1.0
This factor is based on the soil loss due to the effect of conservation practices such as contouring, strip cropping and terracing on erosion. The tributary area to the proposed debris basin is undeveloped desert thus this factor has no significance.

Storm-event runoff volume (V) & storm-event peak flow (Q)
The 10, 5 & 2-year 24-hour storm events were analyzed in HEC-1 to determine each storm's peak flow and volume of runoff. HEC-1 results are in Appendix C.6.

Sediment Yield, Ys=19,415 tons
The 10-year 24-hour storm event produced the highest sediment yield. The volume in acre-feet was determined by dividing the sediment yield by the specific unit weight of soil. Boring Logs per the Nova Geotechnical Report of Village 22 showed the tributary area as having topsoils of Silty Sands (SM), Silty Gravels (GM) & Well-Graded Gravels (GW). SM soil has an approximate unit weight of 18-23 kN/m^3, GM has a unit weight of 20.5-22.5 kN/m^3, and GW has a unit weight of 20-22 kN/m^3. A conservative value of 20 kN/m^3 or 128 lb/ft^3 was assumed for the top soil. Thus, a 10-year 24-hour storm would produce approximately 7.0 acre-feet of soil deposit.

3. Differences between Village 22 MCDS and Proposed TDS

3.1.1. Road Names

Roadways in the Village 22 MCDS are represented by a letter or have been re-named. On the proposed improvement plans and in the report, the roadways are referenced by their proposed name. Table 6 compares the proposed name in the TDS to the MCDS letter.

Table 6 – Village 22 MCDS and TDS Roadway Names

MCDS Street Name	TDS Street Name
Street E	Flight Range Avenue
Street EE	Flight Edge Way
Street F	Kindle Rise Way
Street FF	Hive Bluff Lane
Street G	Fleet Wing Avenue

Street I	Kestrel Creek Avenue
Street J	Kettle Ridge Drive
Street L	Bask Ridge Drive
Street N	Scurry Bend Drive
Summerlin Parkway WB/Street Q	Sunset Run Drive
Carriage Hill Drive	Kettle Bend Road

3.1.2. Hydraulics

The downstream end of the proposed storm drain is a 10'x6' RCB. The MCDS shows a 7'x5' RCB at the same location (SD-F1D). This proposed box culvert had to be upsized because there is a hydraulic jump immediately upstream of this RCB. At the hydraulic jump, the slope of the storm drain decreases to 0.5% from 6.5%. Also, the velocity of flow in the smaller box was higher than the allowable storm drain velocities. By increasing the flow area, the velocity is within the allowable range for Class IV concrete.

REMARKS:

4th & 5th Submittals: Update #1 & Addendum #1 to revise Village 22 in accordance to the Update of the latest overall Summerlin West Master Plan Drainage Study

The Drainage Study for the subject project has been reviewed and:

X	is approved subject to conformance to all City standards and the following conditions:
	must be resubmitted or supplemented including the following:
	is conditionally approved subject to Clark County Regional Flood Control District concurrence.
	is conditionally approved subject to Clark County Public Works Department concurrence.

1. The *Master Drainage Study Update* for *Summerlin West Planning Area* proposes a modification to internal flow patterns that alters the flow patterns to the *Beltway Channel* system downstream of the *Summerlin Parkway* interchange. The modification proposes a storm drain system within *Summerlin Village 22* area (Storm Drain F) that will collect flows from the Gowan channel tributary area and route them into the *Beltway Channel* (MPU Facility APBE 0122). This resulted in increased flows in the *Beltway Channel* segment between *Summerlin Parkway* and *Far Hills Boulevard*, ie, mitigation measures are required for the impacted *Beltway Channel* segment.

A technical drainage study for the analysis, design and construction plans for the Beltway Channel modifications must be submitted and approved by the City prior to the individual onsite parcel developments.

2. The *Grand Park Detention Basin* is proposed to regulate and meter outflow to match the previously approved downstream flow conditions at the junction of *Far Hills* storm drain and the *Beltway Channel*. Without the *Grand Park Detention Basin*, there will be a net increase in flows at the *Beltway Channel* downstream of *Far Hills* intersection exceeding the previously approved flow.

   A technical drainage study for the analysis, design and construction plans for the *Grand Park Detention Basin* must be submitted and approved by the City prior to the individual onsite parcel developments.

NOTE: Any future changes to the proposed design (or design assumptions) as outlined in the approved drainage study and attached preliminary grading plan which affect drainage must be addressed in a Drainage Study Update and accepted by the *City of Las Vegas Flood Control Section*. Additionally, conditional acceptance of a drainage study is valid for a period of one (1) year. If the proposed construction has not been completed in that time period, the *City of Las Vegas* reserves the right to require additional conditions and/or submission and acceptance of a complete drainage study update prior to further construction of a project.

NOTE: Please be advised that all land surface area disturbances over 1 acre or any area adjacent to a water way must submit to the Nevada Division of Environmental Protection a "Notice of Intent" to discharge that certifies a stormwater pollution prevention plan has been developed and is maintained on site; for inclusion in the Stormwater General Permit No. NVR100000. A phased construction unit in a contiguous subdivision is considered under construction until all stripped or disturbed surface areas have been covered by paving, building construction or planting. For more information, including forms and applications see http://ndep.nv.gov/bwpc/storm01.htm or call (775) 687-9429.

*The HEC-1 node shown identifies the controlling concentration point for the associated facility and is located upstream of this facility due to decreasing peak flow with increasing tributary area caused by storm distribution transitions, depth area reduction factors, or attenuation of flow from routing.
**As-built or design slopes were used when available. All other slopes are based on existing topography. The user should verify the facility slope listed prior to performing any facility specific analysis.
^ For parallel facilities, the existing facility flow equals its normal depth capacity, and the proposed parallel facility flow equals the remaining flow (i.e. HEC-1 Node flow = existing facility normal depth capacity + proposed parallel facility flow).

** The HEC-1 node shown identifies the controlling concentration point for the associated facility and is located upstream of this facility due to decreasing peak flow with increasing tributary area caused by storm distribution transitions, depth area reduction factors, or attenuation of flow from routing.*

*** As-built or design slopes were used when available. All other slopes are based on existing topography. The user should verify the facility slope listed prior to performing any facility specific analysis.*

^ For parallel facilities, the existing facility flow equals its normal depth capacity, and the proposed parallel facility flow equals the remaining flow (i.e., HEC-1 Node flow = existing facility normal depth capacity + proposed parallel facility flow).

For the travel time (Tt) calculations,
V1 applies to the first 500 feet of travel distance;
V2 applies to the remaining travel distance.

V1 = 14.8*(S/100)^1/2 Developed V1 = 20.2*(S/100)^1/2
V2 = 29.4*(S/100)^1/2 Developed V2 = 30.6*(S/100)^1/2

REFERENCE : **STANDARD FORM 4**

*Minimum recommended Tc for developed subbasins is 5 mins. A value of 0.05 was use for the Tlag where the calculated Tc was less than 5 mins.

**Minimum recommended Tc for undeveloped subbasins is 10 mins. A value of 0.10 was use for the Tlag where the calculated Tc was less than 10 mins.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Las Vegas Valley Area, Nevada, Part of Clark County
Survey Area Data: Version 13, Sep 14, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 6, 2016—Sep 1, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of six factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and saturated hydraulic conductivity (Ksat). Values of K range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water.

"Erosion factor Kf (rock free)" indicates the erodibility of the fine-earth fraction, or the material less than 2 millimeters in size.

TYPICAL SECTION

NOTES:

1. DESIGN SPECIFICATIONS: "AASHTO LRFD Bridge Design Specifications 2012"
2. CONSTRUCTION SPECIFICATIONS: "State of Nevada Department of Transportation Standard Specifications for Road and Bridge Construction 2014"
3. LIVE LOADS:
   HL–93 Design Truck (32.0 KIP Axle)
   HL–93 Design Tandem (Two 25.0 KIP Axles Spaced 4 Feet Apart)
   (Live Load Impact Factor for Top Slab is 33% up to 2 Feet of Cover)

   LATERAL LIVE LOAD PRESSURE:
   Equivalent to 2 Feet of Earth Surcharge Applied Horizontally = 240 PSF

   DEAD LOADS:
   Soil Unit Weight = 120 PCF
   Min Lateral Earth Pressure = 30 PCF
   Max Lateral Earth Pressure = 60 PCF
4. CONCRETE: Class DA Modified (Major) F'C=4,500 PSI @ 28 Days. (Class D in Clark County)
5. REINFORCING STEEL: All reinforcing steel to be ASTM A615 grade 60 or A706. Dimension relating to bar spacing are center to center
6. DESIGNATION: Box culverts are shown on plans as span times height times length (10' x 8' x 196' RCB).
7. Where traffic loads will be placed directly on the top surface of the culvert, (and/or up to 2 feet of fill), increase top slab thickness by ½ inch and cover for top reinforcement from 2 inches to 2½ inches. Provide epoxy coated reinforcement in top slab (except in Clark County). Decrease spacing of top slab bottom longitudinal bars (#4 @ 12) to 6 inch spacing. Use EA Modified Major concrete (Class E in Clark County) in lieu of Class DA. Adjust quantities accordingly.
8. Provide 2 foot wide Type 1 or Type 2 drain backfill wrapped in Class 1 or Class 2 non-woven geotextile along full height of each culvert exterior wall face.
9. Provide paving notch when top slab is exposed and when pavement is concrete. Adjust quantities accordingly.
10. For additional notes, see sheet B-20.1.1

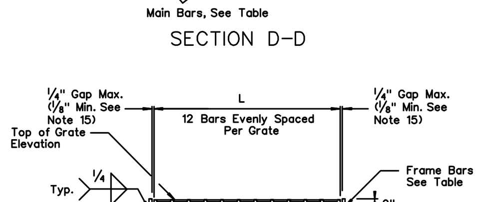
SECTION B–B



SECTION C–C

NOTES:

1. All concrete shall be class A or AA.
2. Reinforcing steel shall be No.4 bars with maximum spacing at 18 inch centers, wired tightly at all intersections and embedded 2 inches clear of all concrete surfaces.
3. Exposed edges of concrete shall be chamfered 1 inch.
4. Dimensions may be varied to fit local conditions if ordered by the engineer.
5. Commercial prefabricated gratings approved by the bridge division may be used in lieu of the field-welded grating shown.
6. Extreme low cover situations to be reviewed by hydraulics engineer.
7. Slope catch basin floors 10:1 from all directions toward outlet pipe. If basin is used as a junction, shape flow line(s) to outlet pipe and provide a 10:1 slpoe to flow line(s).
8. See sheet R-2.9.1 for details if connecting HDPE pipe.
9. A single Type 2 drop inlet shall be constructed unless a double or triple is specified.
10. Single grate configuration shown for clarity. Outside dimensions of each grate shall measure 2 feet by A+4¾".
11. Run rebar continuous thru construction joint. Joint must be a minimum of 3 inches from horizontal bars.
12. Weld one tab on ℄ of grate and remaining two tabs 6 inches from edge of frame. Six tabs per inlet, three tabs on each side
13. Weld tabs 6 inches from edge of frame. Four tabs per grate, two on each side.
14. For multiple grate installations, the station/offset is to the center of the concrete drop inlet structure.
15. Grate is to fit in the frame and be easily removed. If the gap between the grate and frame is greater than ¼" on each side of the grate, the grate and frame shall be removed and reconstructed to the tolerances specified or, with approval of the engineer, a filler strip up to ¼" in thickness may be welded flush to the top of the frame to reduce the gap to a maximum of ¼"
16. Additional pipe penetrations may be placed in any wall. Pipe penetrations are to be to the center of the structure wall unless specified otherwise.
